## 8-bit parallel-in/serial-out shift register

## 74HC/HCT165

## FEATURES

- Asynchronous 8-bit parallel load
- Synchronous serial input
- Output capability: standard
- I<sub>CC</sub> category: MSI

## GENERAL DESCRIPTION

The 74HC/HCT165 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT165 are 8-bit parallel-load or serial-in shift registers with complementary serial outputs ( $\overline{Q_7}$  and  $Q_7$ ) available from the last stage. When the parallel load ( $\overline{PL}$ ) input is LOW, parallel data from the  $D_0$  to  $D_7$  inputs are loaded into the register asynchronously.

When  $\overline{PL}$  is HIGH, data enters the register serially at the  $D_S$  input and shifts one place to the right ( $Q_0 \rightarrow Q_1 \rightarrow Q_2$ , etc.) with each positive-going clock transition. This feature allows parallel-to-serial converter expansion by tying the  $Q_7$  output to the  $D_S$  input of the succeeding stage.

The clock input is a gated-OR structure which allows one input to be used as an active LOW clock enable ( $\overline{CE}$ ) input. The pin assignment for the CP and  $\overline{CE}$  inputs is arbitrary and can be reversed for layout convenience. The LOW-to-HIGH transition of input  $\overline{CE}$  should only take place while CP HIGH for predictable operation. Either the CP or the  $\overline{CE}$  should be HIGH before the LOW-to-HIGH transition of  $\overline{PL}$  to prevent shifting the data when  $\overline{PL}$  is activated.

## APPLICATIONS

- Parallel-to-serial data conversion

C <sub>PD</sub>	power dissipation capacitance per package	notes 1 and 2	35	35	pF

## Notes

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f<sub>i</sub> = input frequency in MHz

f<sub>o</sub> = output frequency in MHz

∑ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = sum of outputs

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is V<sub>I</sub> = GND to V<sub>CC</sub>  
For HCT the condition is V<sub>I</sub> = GND to V<sub>CC</sub> – 1.5 V
