## Miniature, 1W Isolated UNREGULATED DC/DC CONVERTERS

### FEATURES

- UP TO 85% EFFICIENCY
- THERMAL PROTECTION
- DEVICE-TO-DEVICE SYNCHRONIZATION
- SHORT CIRCUIT PROTECTION
- EN55022 CLASS B EMC PERFORMANCE
- UL1950 RECOGNIZED COMPONENT
- JEDEC PDIP-14 AND GULL-WING PACKAGES

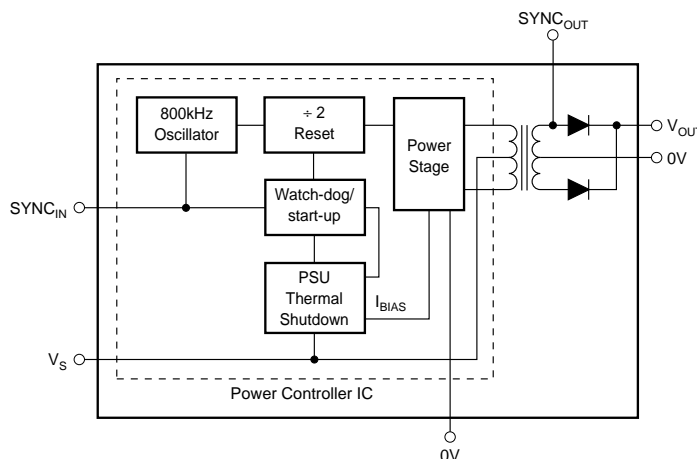

### APPLICATIONS

- POINT-OF-USE POWER CONVERSION
- GROUND LOOP ELIMINATION
- DATA ACQUISITION
- INDUSTRIAL CONTROL AND INSTRUMENTATION
- TEST EQUIPMENT

### DESCRIPTION

The DCP01B series is a family of 1W, unregulated, isolated DC/DC converters. Requiring a minimum of external components and including on-chip device protection, the DCP01B series provides extra features such as output disable and synchronization of switching frequencies.

The use of a highly integrated package design results in highly reliable products with a power density of 40W/in<sup>3</sup> (2.4W/cm<sup>3</sup>). This combination of features and small size makes the DCP01B suitable for a wide range of applications.

# SPECIFICATIONS

## ELECTROSTATIC DISCHARGE SENSITIVITY

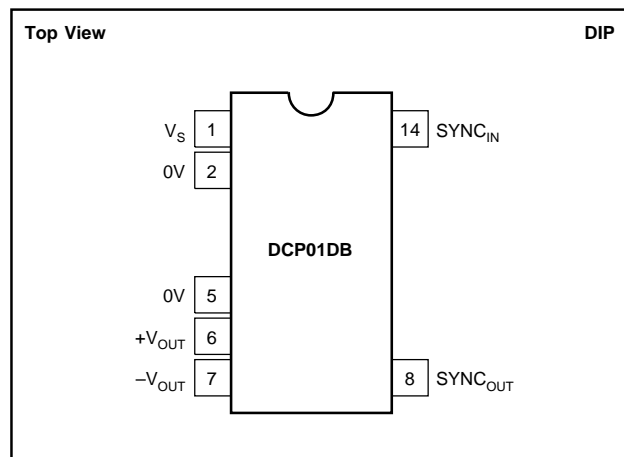

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PIN CONFIGURATION (Single-DIP and Gull-Wing)

## PIN CONFIGURATION (Dual-DIP and Gull-Wing)

## PIN DEFINITION (Single-DIP)

PIN #	PIN NAME	DESCRIPTION
1	V <sub>S</sub>	Voltage Input
2	0V	Input Side Common
5	0V	Output Side Common
6	+V <sub>OUT</sub>	+Voltage Out
7	NC	Not Connected
8	SYNC <sub>OUT</sub>	Unrectified Transformer Output
14	SYNC <sub>IN</sub>	Synchronization Pin

## PIN DEFINITION (Dual-DIP)

PIN #	PIN NAME	DESCRIPTION
1	V <sub>S</sub>	Voltage Input
2	0V	Input Side Common
5	0V	Output Side Common
6	+V <sub>OUT</sub>	+Voltage Out
7	-V <sub>OUT</sub>	-Voltage Out
8	SYNC <sub>OUT</sub>	Unrectified Transformer Output
14	SYNC <sub>IN</sub>	Synchronization Pin

# FUNCTIONAL DESCRIPTION

## OVERVIEW

The DCP01B offers up to 1W of unregulated output power with a typical efficiency of up to 85%. This is achieved through highly integrated packaging technology and the implementation of a custom power stage and control IC. The circuit design utilizes an advanced BiCMOS/DMOS process.

## POWER STAGE

This uses a push-pull, center-tapped topology switching at 400kHz (divide by 2 from 800kHz oscillator).

## OSCILLATOR AND WATCHDOG

The onboard 800kHz oscillator generates the switching frequency via a divide by 2 circuit. The oscillator can be synchronized to other DCP01B circuits or an external source, and is used to minimize system noise.

A watchdog circuit checks the operation of the oscillator circuit. The oscillator can be stopped by pulling the SYNC pin LOW. The output pins will be tri-stated. This will occur in 2μs.

## THERMAL SHUTDOWN

The DCP01B is protected by a thermal shutdown circuit. If the on-chip temperature exceeds 150°C, the device will shut down. Once the temperature falls below 150°C, normal operation will resume.

## SYNCHRONIZATION

In the event that more than one DC/DC converter is needed onboard, beat frequencies and other electrical interference can be generated. This is due to the small variations in switching frequencies between the DC/DC converters.

The DCP01B overcomes this by allowing devices to be synchronized to one another. Up to eight devices can be synchronized by connecting the SYNC<sub>IN</sub> pins together, taking care to minimize the capacitance of tracking. Stray capacitance (> 3pF) will have the effect of reducing the switching frequency, or even stopping the oscillator circuit.

If synchronized devices are used, it should be noted that, at start up, all devices will draw maximum current simultaneously. This can cause the input voltage to dip and should it dip below the minimum input voltage (4.5V), the devices may not start up. A 2.2μF capacitor should be connected close to the input pins.

If more than eight devices are to be synchronized, it is recommended that the SYNC<sub>IN</sub> pins are driven by an external device. Details are contained in a separate applications bulletin (AB-153).

## CONSTRUCTION

The DCP01B's basic construction is the same as standard ICs. There is no substrate within the molded package. The DCP01B is constructed using an IC, rectifier diodes, and a wound magnetic toroid on a leadframe. As there is no solder within the package, the DCP01B does not require any special PCB assembly processing. This results in an isolated DC/DC converter with inherently high reliability.

# ADDITIONAL FUNCTIONS

## DISABLE/ENABLE

The DCP01B can be disabled or enabled by driving the SYNC pin using an open drain CMOS gate. If the SYNC<sub>IN</sub> pin is pulled low, the DCP01B will be disabled. The disable time depends upon the external loading; the internal disable function is implemented in 2μs. Removal of the pull down will cause the DCP01B to be enabled.

Capacitive loading on the SYNC<sub>IN</sub> pin should be minimized in order to prevent a reduction in the oscillator frequency.

## DECOUPLING

### Ripple Reduction

The high switching frequency of 400kHz allows simple filtering. To reduce ripple, it is recommended that at least a 1μF capacitor is used on V<sub>OUT</sub>. Dual outputs should both be decoupled to pin 5. A 2.2μF low ESR capacitor on the input of the 5V in versions, and a 0.47μF low ESR cap on the 24V DCP01B in versions is recommended.

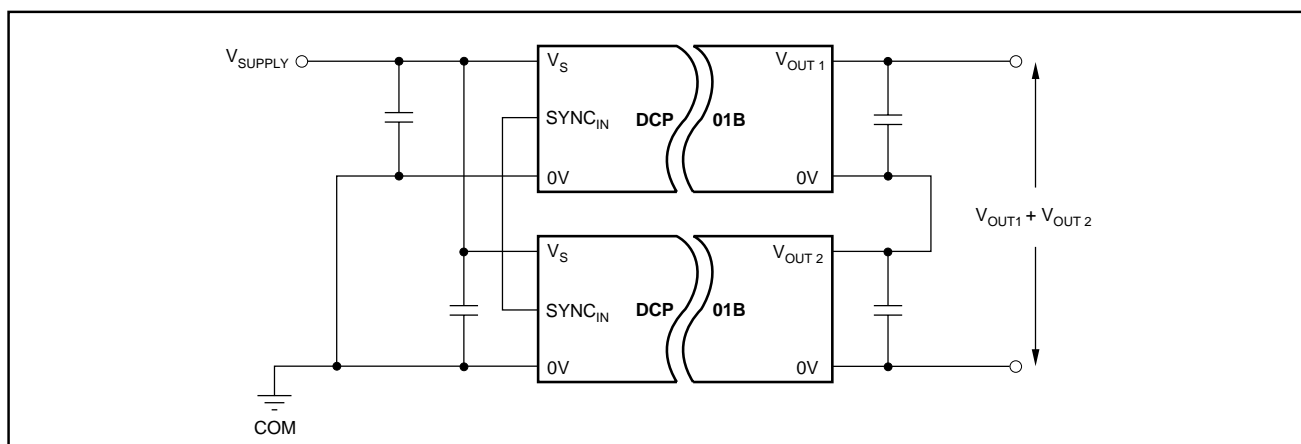

FIGURE 1. Connecting the DCP01B in Series.

## Connecting the DCP01B in Series

Multiple DCP01B isolated 1W DC/DC converters can be connected in series to provide nonstandard voltage rails. This is possible by utilizing the floating outputs provided by the DCP01B's galvanic isolation.

Connect the positive  $V_{OUT}$  from one DCP01B to the negative  $V_{OUT}$  (0V) of another (see Figure 1). If the  $SYNC_{IN}$  pins are tied together, the self-synchronization feature of the DCP01B will prevent beat frequencies on the voltage rails. The  $SYNC_{IN}$  feature of the DCP01B allows easy series connection without external filtering, minimizing cost.

The outputs on dual output DCP01B versions can also be connected in series to provide two times the magnitude of  $V_{OUT}$  as shown in Figure 2. For example, a dual 15V DCP01B could be connected to provide a 30V rail.

## Connecting the DCP01B in Parallel

If the output power from one DCP01B is not sufficient, it is possible to parallel the outputs of multiple DCP01Bs, as shown in Figure 3. Again, the  $SYNC_{IN}$  feature allows easy synchronization to prevent power-rail beat frequencies at no additional filtering cost.

## PCB LAYOUT

### Ripple and Noise

Careful consideration should be given to the layout of the PCB in order that the best results can be obtained.

The DCP01B is a switching power supply and as such can place high peak current demands on the input supply. In order to avoid the supply falling momentarily during the fast switching pulses ground and power planes should be used to track the power to the input of DCP01B. If this is not possible then the supplies must be connected in a star formation with the tracks made as wide as possible.

If the  $SYNC_{IN}$  pin is being used then the tracking between device  $SYNC_{IN}$  pins should be short to avoid stray capacitance. If the  $SYNC_{IN}$  pin is not being used it is advisable to place a guard ring, (connected to input ground) around this pin to avoid any noise pick up.

The output should be taken from the device using ground and power planes, this will ensure minimum losses.

A good quality low ESR capacitor placed as close as practicable across the input will reduce reflected ripple and ensure a smooth start up.

A good quality low ESR capacitor placed as close as practicable across the rectifier output terminal and output ground will give the best ripple and noise performance.

## THERMAL MANAGEMENT

Due to the high power density of this device it is advisable to provide ground planes on the input and output.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
