

## Features

- TSOP I Package Configurable as 1M x 16 or 2M x 8 SRAM
- Very High Speed: 45 ns
- Temperature Ranges
  - Industrial: -40°C to +85°C
  - Automotive-A: -40°C to +85°C
- Wide Voltage Range: 2.20V to 3.60V
- Ultra Low Standby Power
  - Typical standby current: 1.5  $\mu$ A
  - Maximum standby current: 12  $\mu$ A
- Ultra Low Active Power
  - Typical active current: 2.2 mA at f = 1 MHz
- Easy Memory Expansion with  $\overline{CE}_1$ ,  $CE_2$ , and  $\overline{OE}$  Features
- Automatic Power Down when Deselected
- CMOS for Optimum Speed and Power
- Offered in Pb-free 48-Ball VFBGA and 48-Pin TSOP I Packages

## Functional Description

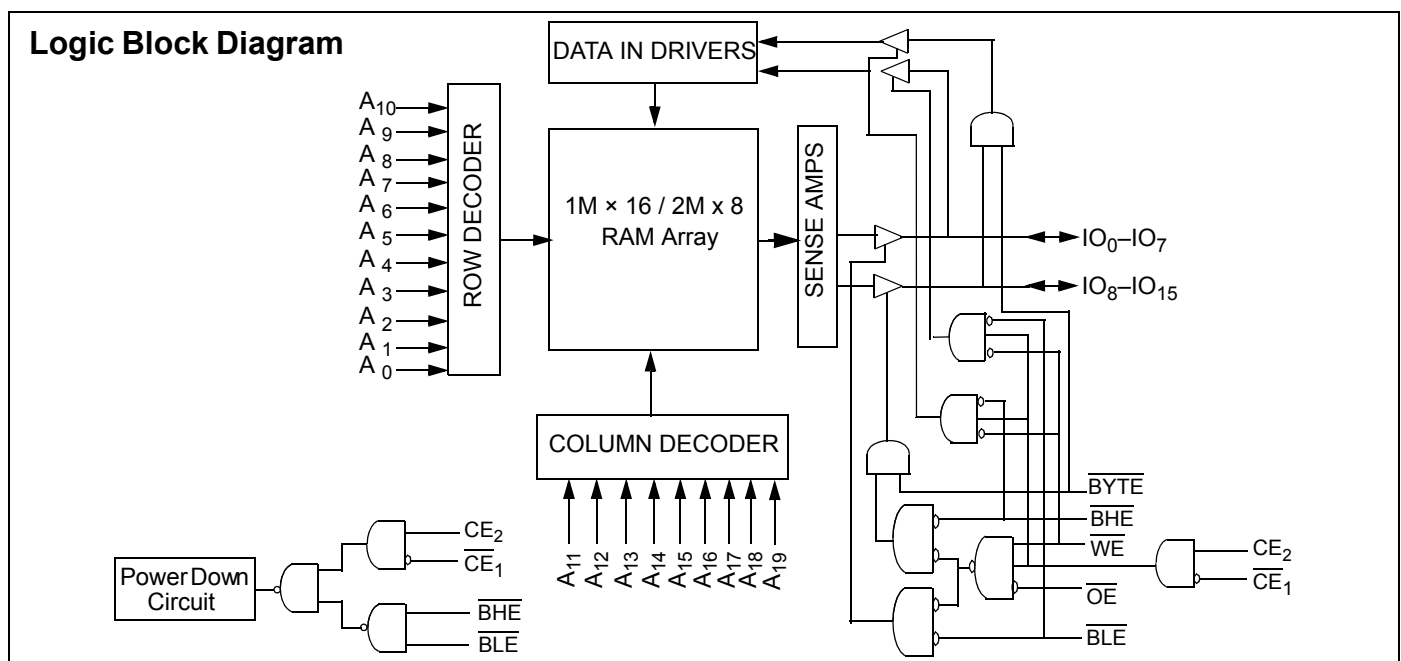

The CY62167EV30 is a high performance CMOS static RAM organized as 1M words by 16 bits or 2M words by 8 bits. This device features an advanced circuit design that provides an ultra

low active current. Ultra low active current is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that reduces power consumption by 99 percent when addresses are not toggling. Place the device into standby mode when deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW or both BHE and BLE are HIGH). The input and output pins (I/O<sub>0</sub> through I/O<sub>15</sub>) are placed in a high impedance state when: the device is deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW), outputs are disabled ( $\overline{OE}$  HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH), or a write operation is in progress ( $\overline{CE}_1$  LOW,  $CE_2$  HIGH and WE LOW).

To write to the device, take Chip Enables ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and Write Enable (WE) input LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O<sub>0</sub> through I/O<sub>7</sub>) is written into the location specified on the address pins (A<sub>0</sub> through A<sub>19</sub>). If Byte High Enable (BHE) is LOW, then data from the I/O pins (I/O<sub>8</sub> through I/O<sub>15</sub>) is written into the location specified on the address pins (A<sub>0</sub> through A<sub>19</sub>).

To read from the device, take Chip Enables ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and Output Enable ( $\overline{OE}$ ) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins appears on I/O<sub>0</sub> to I/O<sub>7</sub>. If Byte High Enable (BHE) is LOW, then data from memory appears on I/O<sub>8</sub> to I/O<sub>15</sub>. See the "Truth Table" on page 9 for a complete description of read and write modes.

For best practice recommendations, refer to the Cypress application note [AN1064, SRAM System Guidelines](#).

### Notes

- The information related to 6 x 7 x 1 mm VFBGA package is preliminary.
- Ball H6 for the VFBGA package can be used to upgrade to a 32M density.
- NC pins are not connected on the die.
- The BYTE pin in the 48-TSOP I package has to be tied to V<sub>CC</sub> to use the device as a 1M X 16 SRAM. The 48-TSOP I package can also be used as a 2M X 8 SRAM by tying the BYTE signal to V<sub>SS</sub>. In the 2M x 8 configuration, Pin 45 is A20, while BHE, BLE and IO<sub>8</sub> to IO<sub>14</sub> pins are not used.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = V<sub>CC</sub>(typ), T<sub>A</sub> = 25°C.

## Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... -65°C to + 150°C

Ambient Temperature with Power Applied ..... -55°C to + 125°C

Supply Voltage to Ground Potential ..... -0.3V to 3.9V  $V_{CC(max)} + 0.3V$

DC Voltage Applied to Outputs in High Z State<sup>[6, 7]</sup> ..... -0.3V to 3.9V  $V_{CC(max)} + 0.3V$

DC Input Voltage<sup>[6, 7]</sup> ..... -0.3V to 3.9V ( $V_{CC(max)} + 0.3V$ )

Output Current into Outputs (LOW) ..... 20 mA

Static Discharge Voltage ..... >2001V (MIL-STD-883, Method 3015)

Latch up Current ..... >200 mA

## Operating Range

| Device        | Range              | Ambient Temperature | $V_{CC}$ <sup>[8]</sup> |
|---------------|--------------------|---------------------|-------------------------|
| CY62167EV30LL | Industrial/ Auto-A | -40°C to +85°C      | 2.2V to 3.6V            |

## Capacitance

Tested initially and after any design or process changes that may affect these parameters.

| Parameter        | Description        | Test Conditions                        | Max | Unit |
|------------------|--------------------|--|-----|------|
| C <sub>IN</sub>  | Input Capacitance  | T <sub>A</sub> = 25°C, f = 1 MHz,      | 10  | pF   |
| C <sub>OUT</sub> | Output Capacitance | V <sub>CC</sub> = V <sub>CC(typ)</sub> | 10  | pF   |

### Notes

- V<sub>IL</sub>(min) = -2.0V for pulse durations less than 20 ns.
- V<sub>IH</sub>(max) = V<sub>CC</sub> + 0.75V for pulse durations less than 20 ns.
- Full Device AC operation assumes a 100 μs ramp time from 0 to V<sub>CC</sub> (min) and 200 μs wait time after V<sub>CC</sub> stabilization.
- Under DC conditions the device meets a V<sub>IL</sub> of 0.8V. However, in dynamic conditions Input LOW Voltage applied to the device must not be higher than 0.7V. This is applicable to TSOP I package only.
- Only chip enables (CE<sub>1</sub> and CE<sub>2</sub>), byte enables (BHE and BLE) and BYTE must be tied to CMOS levels to meet the I<sub>SB2</sub> / I<sub>CCDR</sub> spec. Other inputs can be left floating

## Thermal Resistance

Tested initially and after any design or process changes that may affect these parameters.

| Parameter     | Description                                 | Test Conditions   | VFBGA<br>(6 x 7 x 1mm) | VFBGA<br>(6 x 8 x 1mm) | TSOP I | Unit |

**Figure 4. Data Retention Waveform**

### Notes

11. Tested initially and after any design or process changes that may affect these parameters.
12. Full device operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC}(\min) \geq 100 \mu s$  or stable at  $V_{CC}(\min) \geq 100 \mu s$ .
13.  $\overline{BHE.BLE}$  is the AND of both  $\overline{BHE}$  and  $\overline{BLE}$ . Deselect the chip by either disabling the chip enable signals or by disabling both  $\overline{BHE}$  and  $\overline{BLE}$ .

### Notes

14. Test conditions for all parameters other than tri-state parameters assume signal transition time of 1 V/ns, timing reference levels of  $V_{CC}(typ)/2$ , input pulse levels of 0 to  $V_{CC}(typ)$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in "AC Test Loads and Waveforms" on page 4.
15. AC timing parameters are subject to byte enable signals ( $\overline{BHE}$  or  $\overline{BLE}$ ) not switching when chip is disabled. See application note AN13842 for further clarification.
16. At any temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZBE}$  is less than  $t_{LZBE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any device.
17.  $t_{HZOE}$ ,  $t_{HZCE}$ ,  $t_{HZBE}$ , and  $t_{HZWE}$  transitions are measured when the outputs enter a high impedance state.
18. The internal write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE}_1 = V_{IL}$ ,  $\overline{BHE}$  or  $\overline{BLE}$  or both =  $V_{IL}$ , and  $CE_2 = V_{IH}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must refer to the edge of the signal that terminates the write.

## Switching Waveforms

Figure 5 shows address transition controlled read cycle waveforms.<sup>[19, 20]</sup>

Figure 5. Read Cycle No. 1

Figure 6 shows  $\overline{OE}$  controlled read cycle waveforms.<sup>[20, 21]</sup>

Figure 6. Read Cycle No. 2

### Notes

19. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}_1 = V_{IL}$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  or both =  $V_{IL}$ , and  $CE_2 = V_{IH}$ .
20.  $\overline{WE}$  is HIGH for read cycle.
21. Address valid before or similar to  $\overline{CE}_1$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  transition LOW and  $CE_2$  transition HIGH.

Switching Waveforms (continued)

Figure 7 shows  $\overline{WE}$  controlled write cycle waveforms.<sup>[18, 22, 23]</sup>

Figure 7. Write Cycle No. 1

Notes

- 22. Data IO is high impedance if  $\overline{OE} = V_{IH}$ .
- 23. If  $\overline{CE}_1$  goes HIGH and  $CE_2$  goes LOW simultaneously with  $\overline{WE} = V_{IH}$ , the output remains in a high impedance state.
- 24. During this period the I/Os are in output state. Do not apply input signals.

Switching Waveforms (continued)

Figure 8 shows  $\overline{CE}_1$  or  $CE_2$  controlled write cycle waveforms.<sup>[18, 22, 23]</sup>

Figure 8. Write Cycle No. 2

Figure 9 shows  $\overline{WE}$  controlled,  $\overline{OE}$  LOW write cycle waveforms.<sup>[23]</sup>

Figure 9. Write Cycle No. 3

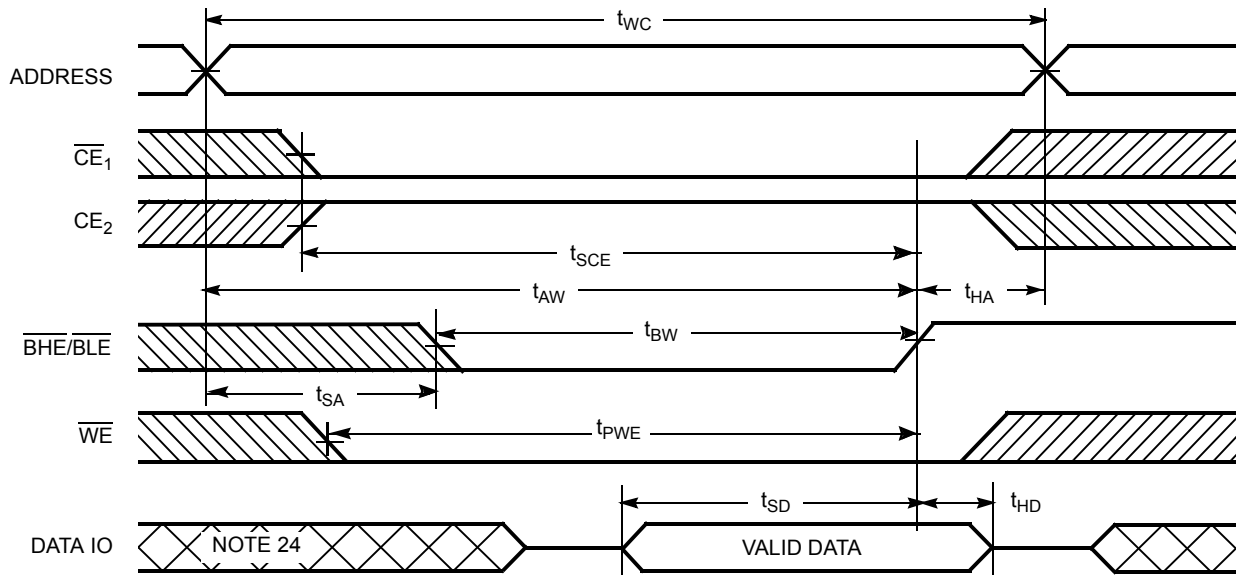

Switching Waveforms (continued)

Figure 10 shows  $\overline{\text{BHE}}/\overline{\text{BLE}}$  controlled,  $\overline{\text{OE}}$  LOW write cycle waveforms.<sup>[23]</sup>

Figure 10. Write Cycle No. 4

Truth Table

| $\overline{\text{CE}}_1$ | $\overline{\text{CE}}_2$ | $\overline{\text{WE}}$ | $\overline{\text{OE}}$ | $\overline{\text{BHE}}$ | $\overline{\text{BLE}}$ | Inputs/Outputs   | Mode                  | Power                |
|--------------------------|--------------------------|------------------------|------------------------|-------------------------|-------------------------|--|-----------------------|----------------------|
