

Miniature Single Cell, Fully Integrated Li-Ion, Li-Polymer Charge Management Controller

Features:

- Linear Charge Management Controller:
 - Integrated Pass Transistor
 - Integrated Current Sense
 - Reverse Discharge Protection
- High Accuracy Preset Voltage Regulation: $\pm 0.75\%$
- Four Voltage Regulation Options:
 - 4.20V, 4.35V, 4.40V, 4.50V
- Programmable Charge Current
- Selectable Preconditioning
- Selectable End-of-Charge Control
- Charge Status Output
- Automatic Power-Down
- Thermal Regulation
- Temperature Range: -40°C to $+85^{\circ}\text{C}$
- Packaging:
 - 8-Lead, 2 mm x 3 mm DFN
 - 5-Lead, SOT23

Applications:

- Lithium-Ion/Lithium-Polymer Battery Chargers
- Personal Data Assistants
- Cellular Telephones
- Digital Cameras
- MP3 Players
- Bluetooth Headsets
- USB Chargers

Typical Application

Description:

The MCP73831 is a highly advanced linear charge management controller for use in space-limited, cost sensitive applications. The MCP73831 is available in an 8-Lead, 2 mm x 3 mm DFN package or a 5-Lead, SOT23 package. Along with its small physical size, the low number of external components required makes the MCP73831 ideally suited for portable applications. For applications charging from a USB port, the MCP73831 adheres to all the specifications governing the USB power bus.

The MCP73831 employs a constant-current/constant-voltage charge algorithm with selectable preconditioning and charge termination. The constant voltage regulation is fixed with four available options: 4.20V, 4.35V, 4.40V, or 4.50V, to accommodate new, emerging battery charging requirements. The constant current value is set with one external resistor. The MCP73831 limits the charge current based on die temperature during high power or high ambient conditions. This thermal regulation optimizes the charge cycle time while maintaining device reliability.

Several options are available for the preconditioning threshold, preconditioning current value, charge termination value, and automatic recharge threshold. The preconditioning value and charge termination value are set as a ratio, or percentage, of the programmed constant current value. Preconditioning can be disabled. Refer to **Section 1.0 "Electrical Characteristics"** for available options and the Product Identification System for standard options.

The MCP73831 is fully specified over the ambient temperature range of -40°C to $+85^{\circ}\text{C}$.

MCP73831

Functional Block Diagram

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

V_{DDN} 7.0V
 All Inputs and Outputs w.r.t. V_{SS} -0.3 to ($V_{DD}+0.3$)V
 Maximum Junction Temperature, T_J Internally Limited
 Storage temperature -65°C to +150°C
 ESD protection on all pins:
 Human Body Model (1.5 kΩ in Series with 100 pF) ≥ 4 kV
 Machine Model (200 pF, No Series Resistance) 400V

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, all limits apply for $V_{DD} = [V_{REG}(typ.) + 0.3V]$ to 6V, $T_A = -40°C$ to +85°C. Typical values are at +25°C, $V_{DD} = [V_{REG}(typ.) + 1.0V]$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Supply Input						
Supply Voltage	V_{DD}	3.75	—	6	V	
Supply Current	I_{SS}	—	510	1500	μA	Charging
		—	53	200	μA	Charge Complete, No Battery
		—	25	50	μA	PROG Floating
		—	1	5	μA	$V_{DD} \leq (V_{BAT} - 50 \text{ mV})$
		—	0.1	2	μA	$V_{DD} < V_{STOP}$
UVLO Start Threshold	V_{START}	3.3	3.45	3.6	V	V_{DD} Low-to-High

3.0 PIN DESCRIPTION

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLES

Pin No.		Symbol	Function
DFN	SOT23-5		
1	4	V_{DD}	Battery Management Input Supply
2	—	V_{DD}	Battery Management Input Supply
3	3	V_{BAT}	Battery Charge Control Output
4	—	V_{BAT}	Battery Charge Control Output
5	1	STAT	Charge Status Output
6	2	V_{SS}	Battery Management 0V Reference
7	—	NC	No Connection
8	5	PROG	Current Regulation Set and Charge Control Enable

3.1 Battery Management Input Supply (V_{DD})

A supply voltage of [V_{REG} (typ.) + 0.3V] to 6V is recommended. Bypass to V_{SS} with a minimum of 4.7 μ F.

3.2 Battery Charge Control Output (V_{BAT})

Connect to positive terminal of battery. Drain terminal of internal P-channel MOSFET pass transistor. Bypass to V_{SS} with a minimum of 4.7 μ F to ensure loop stability when the battery is disconnected.

3.3 Charge Status Output (STAT)

STAT is a tri-state logic output for connection to an LED for charge status indication. Alternatively, a pull-up resistor can be applied for interfacing to a host microcontroller.

3.4 Battery Management 0V Reference (V_{SS})

Connect to negative terminal of battery and input supply.

3.5 Current Regulation Set (PROG)

Preconditioning, fast charge, and termination currents are scaled by placing a resistor from PROG to V_{SS} .

The charge management controller can be disabled by allowing the PROG input to float.

MCP73831

4.0 DEVICE OVERVIEW

The MCP73831 is a highly advanced linear charge management controller. Figure 4-1 depicts the operational flow algorithm from charge initiation to completion and automatic recharge.

FIGURE 4-1: Flowchart.

4.1 Under Voltage Lockout (UVLO)

An internal under voltage lockout (UVLO) circuit monitors the input voltage and keeps the charger in Shutdown mode until the input supply rises above the UVLO threshold. The UVLO circuitry has a built in hysteresis of 100 mV.

In the event a battery is present when the input power is applied, the input supply must rise 150 mV above the battery voltage before the MCP73831 becomes operational.

The UVLO circuit places the device in Shutdown mode if the input supply falls to within 50 mV of the battery voltage. Again, the input supply must rise to a level 150 mV above the battery voltage before the MCP73831 becomes operational.

The UVLO circuit is always active. At any time the input supply is below the UVLO threshold or within 50 mV of the voltage at the V_{BAT} pin, the MCP73831 is placed in a Shutdown mode.

During any UVLO condition, the battery reverse discharge current shall be less than $2\text{ }\mu\text{A}$.

4.2 Charge Qualification

For a charge cycle to begin, all UVLO conditions must be met and a battery or output load must be present. A charge current programming resistor must be connected from PROG to V_{SS} . If the PROG pin is open or floating, the MCP73831 is disabled and the battery reverse discharge current is less than $2\text{ }\mu\text{A}$. In this manner, the PROG pin acts as a charge enable and can be used as a manual shutdown.

4.3 Preconditioning

If the voltage at the V_{BAT} pin is less than the preconditioning threshold, the MCP73831 enters a preconditioning or Trickle Charge mode. The preconditioning threshold is factory set. Refer to **Section 1.0 "Electrical Characteristics"** for preconditioning threshold options and the Product Identification System for standard options.

In this mode, the MCP73831 supplies a percentage of the charge current (established with the value of the resistor connected to the PROG pin) to the battery. The percentage or ratio of the current is factory set. Refer to **Section 1.0 "Electrical Characteristics"** for preconditioning current options and the Product Identification System for standard options.

When the voltage at the V_{BAT} pin rises above the preconditioning threshold, the MCP73831 enters the Constant-Current or Fast Charge mode.

4.4 Fast Charge Constant-Current Mode

During the Constant-Current mode, the programmed charge current is supplied to the battery or load. The charge current is established using a single resistor from PROG to V_{SS} . Constant-Current mode is maintained until the voltage at the V_{BAT} pin reaches the regulation voltage, V_{REG} .

4.5 Constant-Voltage Mode

When the voltage at the V_{BAT} pin reaches the regulation voltage, V_{REG} , constant voltage regulation begins. The regulation voltage is factory set to 4.2V, 4.35V, 4.40V, or 4.50V with a tolerance of $\pm 0.75\%$.

4.6 Charge Termination

The charge cycle is terminated when, during Constant-Voltage mode, the average charge current diminishes below a percentage of the programmed charge current (established with the value of the resistor connected to the PROG pin). A 1 ms filter time on the termination comparator ensures that transient load conditions do not result in premature charge cycle termination. The percentage or ratio of the current is factory set. Refer to **Section 1.0 “Electrical Characteristics”** for charge termination current options and the Product Identification System for standard options.

The charge current is latched off and the MCP73831 enters a Charge Complete mode.

4.7 Automatic Recharge

The MCP73831 continuously monitors the voltage at the V_{BAT} pin in the Charge Complete mode. If the voltage drops below the recharge threshold, another charge cycle begins and current is once again supplied to the battery or load. The recharge threshold is factory set. Refer to **Section 1.0 “Electrical Characteristics”** for recharge threshold options and the Product Identification System for standard options.

4.8 Thermal Regulation

The MCP73831 limits the charge current based on the die temperature. The thermal regulation optimizes the charge cycle time while maintaining device reliability. Figure 4-2 depicts the thermal regulation for the MCP73831.

FIGURE 4-2: Thermal Regulation.

4.9 Thermal Shutdown

The MCP73831 suspends charge if the die temperature exceeds 150°C. Charging will resume when the die temperature has cooled by approximately 10°C.

MCP73831

5.0 DETAILED DESCRIPTION

5.1 Analog Circuitry

5.1.1 BATTERY MANAGEMENT INPUT SUPPLY (V_{DD})

The V_{DD} input is the input supply to the MCP73831. The MCP73831 automatically enters a Power-Down mode if the voltage on the V_{DD} input falls below the UVLO voltage (V_{STOP}). This feature prevents draining the battery pack when the V_{DD} supply is not present.

5.1.2 CURRENT REGULATION SET (PROG)

Fast charge current regulation can be scaled by placing a programming resistor (R_{PROG}) from the PROG input to V_{SS} . The program resistor and the charge current are calculated using the following equation:

$$I_{REG} = \frac{1000V}{R_{PROG}}$$

Where:

$$\begin{aligned} R_{PROG} &= \text{kOhms} \\ I_{REG} &= \text{milliampere} \end{aligned}$$

The preconditioning trickle charge current and the charge termination current are ratiometric to the fast charge current based on the selected device options.

5.1.3 BATTERY CHARGE CONTROL OUTPUT (V_{BAT})

The battery charge control output is the drain terminal of an internal P-channel MOSFET. The MCP73831 provides constant current and voltage regulation to the battery pack by controlling this MOSFET in the linear region. The battery charge control output should be connected to the positive terminal of the battery pack.

5.2 Digital Circuitry

5.2.1 STATUS INDICATOR (STAT)

The charge status output has three different states: High (H), Low (L), and High-Impedance (Hi-Z). The charge status output can be used to illuminate 1, 2, or tricolor LEDs. Optionally, the charge status output can be used as an interface to a host microcontroller. Table 5-1 summarizes the state of the status output during a charge cycle.

TABLE 5-1: STATUS OUTPUT

Charge Cycle State	STAT1
Shutdown	Hi-Z
No Battery Present	Hi-Z
Preconditioning	L
Constant-Current Fast Charge	L
Constant Voltage	L
Charge Complete – Standby	H

5.2.2 DEVICE DISABLE (PROG)

The current regulation set input pin (PROG) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Placing a programming resistor from the PROG input to V_{SS} enables the device. Allowing the PROG input to float or by applying a logic-high input signal, disables the device and terminates a charge cycle. When disabled, the device's supply current is reduced to 25 μA , typically.

6.0 APPLICATIONS

The MCP73831 is designed to operate in conjunction with a host microcontroller or in a stand-alone application. The MCP73831 provides the preferred charge algorithm for Lithium-Ion and Lithium-Polymer cells

constant current followed by constant voltage. Figure 6-1 depicts a typical stand-alone application circuit, while Figures 6-2 and 6-3 depict the accompanying charge profile.

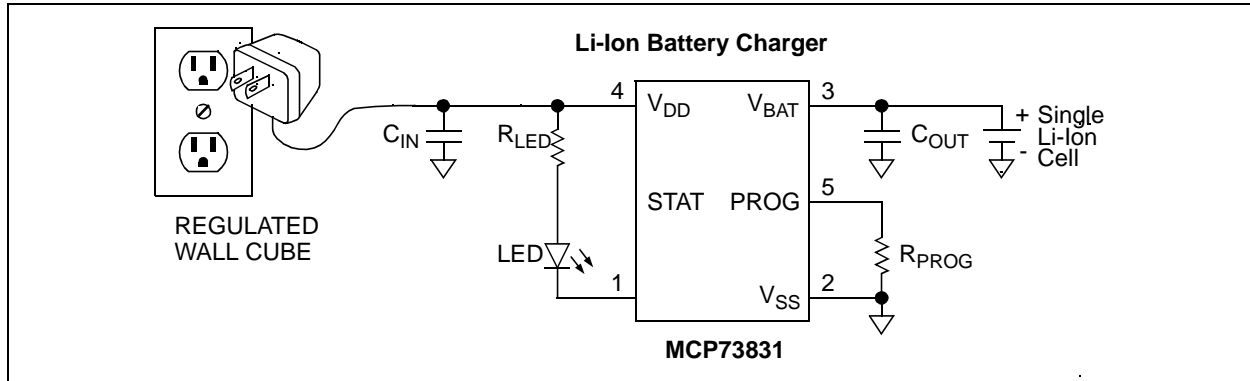

FIGURE 6-1: Typical Application Circuit.

FIGURE 6-2: Typical Charge Profile (180 mAh Battery).

FIGURE 6-3: Typical Charge Profile in Thermal Regulation (1000 mAh Battery).

6.1 Application Circuit Design

Due to the low efficiency of linear charging, the most important factors are thermal design and cost, which are a direct function of the input voltage, output current and thermal impedance between the battery charger and the ambient cooling air. The worst-case situation is when the device has transitioned from the Preconditioning mode to the Constant-Current mode. In this situation, the battery charger has to dissipate the maximum power. A trade-off must be made between the charge current, cost and thermal requirements of the charger.

6.1.1 COMPONENT SELECTION

Selection of the external components in Figure 6-1 is crucial to the integrity and reliability of the charging system. The following discussion is intended as a guide for the component selection process.

6.1.1.1 Current Programming Resistor (R_{PROG})

The preferred fast charge current for Lithium-Ion cells is at the 1C rate, with an absolute maximum current at the 2C rate. For example, a 500 mAh battery pack has a preferred fast charge current of 500 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

6.1.1.2 Thermal Considerations

The worst-case power dissipation in the battery charger occurs when the input voltage is at the maximum and the device has transitioned from the Preconditioning mode to the Constant-Current mode. In this case, the power dissipation is:

MCP73831

$$PowerDissipation = (V_{DDMAX} - V_{PTHMIN}) \times I_{REGMAX}$$

Where:

- V_{DDMAX} = the maximum input voltage
- I_{REGMAX} = the maximum fast charge current
- V_{PTHMIN} = the minimum transition threshold voltage

Power dissipation with a 5V, $\pm 10\%$ input voltage source is:

$$PowerDissipation = (5.5V - 2.7V) \times 550mA = 1.54W$$

This power dissipation with the battery charger in the SOT23-5 package will cause thermal regulation to be entered as depicted in Figure 6-3. Alternatively, the 2mm x 3mm DFN package could be utilized to reduce charge cycle times.

6.1.1.3 External Capacitors

The MCP73831 is stable with or without a battery load. In order to maintain good AC stability in the Constant-Voltage mode, a minimum capacitance of 4.7 μF is recommended to bypass the V_{BAT} pin to V_{SS} . This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during Constant-Voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

Virtually any good quality output filter capacitor can be used, independent of the capacitor's minimum Effective Series Resistance (ESR) value. The actual value of the capacitor (and its associated ESR) depends on the output load current. A 4.7 μF ceramic, tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability for output currents up to a 500 mA.

6.1.1.4 Reverse-Blocking Protection

The MCP73831 provides protection from a faulted or shorted input. Without the protection, a faulted or shorted input would discharge the battery pack through the body diode of the internal pass transistor.

6.1.1.5 Charge Inhibit

The current regulation set input pin (PROG) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Placing a programming resistor from the PROG input to V_{SS} enables the device. Allowing the PROG input to float or by applying a logic-high input signal, disables the device and terminates a charge cycle. When disabled, the device's supply current is reduced to 25 μA , typically.

6.1.1.6 Charge Status Interface

A status output provides information on the state of charge. The output can be used to illuminate external LEDs or interface to a host microcontroller. Refer to Table 5-1 for a summary of the state of the status output during a charge cycle.

6.2 PCB Layout Issues

For optimum voltage regulation, place the battery pack as close as possible to the device's V_{BAT} and V_{SS} pins. This is recommended to minimize voltage drops along the high current-carrying PCB traces.

If the PCB layout is used as a heatsink, adding many vias in the heatsink pad can help conduct more heat to the backplane of the PCB, thus reducing the maximum junction temperature. Figures 6-4 and 6-5 depict a typical layout with PCB heatsinking.

FIGURE 6-4: Typical Layout (Top).

FIGURE 6-5: Typical Layout (Bottom).

7.0 PACKAGING INFORMATION

7.1 Package Marking Information

8-Lead DFN (2 mm x 3 mm)

Device	Code
MCP73831T-2ACI/MC	AAE
MCP73831T-2ATI/MC	AAF
MCP73831T-2DCI/MC	AAG
MCP73831T-3ACI/MC	AAH
MCP73831T-4ADI/MC	AAJ

* Controlling Parameter

** Not within JEDEC parameters

§ Significant Characteristic

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.

2. Exposed pad may vary according to die attach paddle size.

3. Package may have one or more exposed tie bars at ends.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

See ASME Y14.5M

REF: Reference Dimension, usually without tolerance, for information purposes only.

See ASME Y14.5M

	AT	10	71.5	20	94
	DC	100	x	7.5	96.5
	* Consult Factory for Alternative Device Options				
Temperature Range:	I	= -40°C to +85°C (Industrial)			
Package:	MC	= Dual-Flat, No-Lead (2x3 mm body), 8-Lead			
	OT	= Small Outline Transistor (SOT23), 5-Lead			
Examples: *					
a) MCP73831T-2ACI/OT: Tape and Reel, 4.20V V _{REG} , Options AC, 5LD SOT23 Pkg					
b) MCP73831T-2ACI/OT: Tape and Reel, 4.20V V _{REG} , Options AC, 5LD SOT23 Pkg					
c) MCP73831T-2ACI/MC: Tape and Reel, 4.20V V _{REG} , Options AC, 8LD DFN Package					
d) MCP73831T-2ACI/MC: Tape and Reel, 4.20V V _{REG} , Options AC, 8LD DFN Package					
a) MCP73831T-2ATI/OT: Tape and Reel, 4.20V V _{REG} , Options AT, 5LD SOT23 Pkg					
b) MCP73831T-2ATI/OT: Tape and Reel, 4.20V V _{REG} , Options AT, 5LD SOT23 Pkg					
c) MCP73831T-2ATI/MC: Tape and Reel, 4.20V V _{REG} , Options AT, 8LD DFN Package					
d) MCP73831T-2ATI/MC: Tape and Reel, 4.20V V _{REG} , Options AT, 8LD DFN Package					
a) MCP73831T-2DCI/OT: Tape and Reel, 4.20V V _{REG} , Options DC, 5LD SOT23 Pkg					
b) MCP73831T-2DCI/OT: Tape and Reel, 4.20V V _{REG} , Options DC, 5LD SOT23 Pkg					
c) MCP73831T-2DCI/MC: Tape and Reel, 4.20V V _{REG} , Options DC, 8LD DFN Package					
d) MCP73831T-2DCI/MC: Tape and Reel, 4.20V V _{REG} , Options DC, 8LD DFN Package					
a) MCP73831T-3ACI/OT: Tape and Reel, 4.35V V _{REG} , Options AC, 5LD SOT23 Pkg					
b) MCP73831T-3ACI/OT: Tape and Reel, 4.35V V _{REG} , Options AC, 5LD SOT23 Pkg					
c) MCP73831T-3ACI/MC: Tape and Reel, 4.35V V _{REG} , Options AC, 8LD DFN Package					
d) MCP73831T-3ACI/MC: Tape and Reel, 4.35V V _{REG} , Options AC, 8LD DFN Package					
a) MCP73831T-4ADI/OT: Tape and Reel, 4.40V V _{REG} , Options AD, 5LD SOT23 Pkg					
b) MCP73831T-4ADI/OT: Tape and Reel, 4.40V V _{REG} , Options AD, 5LD SOT23 Pkg					
c) MCP73831T-4ADI/MC: Tape and Reel, 4.40V V _{REG} , Options AD, 8LD DFN Package					
d) MCP73831T-4ADI/MC: Tape and Reel, 4.40V V _{REG} , Options AD, 8LD DFN Package					
a) MCP73831T-5ACI/OT: Tape and Reel, 4.50V V _{REG} , Options AC, 5LD SOT23 Pkg					
b) MCP73831T-5ACI/OT: Tape and Reel, 4.50V V _{REG} , Options AC, 5LD SOT23 Pkg					
c) MCP73831T-5ACI/MC: Tape and Reel, 4.50V V _{REG} , Options AC, 8LD DFN Package					
d) MCP73831T-5ACI/MC: Tape and Reel, 4.50V V _{REG} , Options AC, 8LD DFN Package

MCP73831

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELoQ, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rPIC, and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, Migratable Memory, MXDEV, MXLAB, PICMASTER, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, dsPICDEM, dsPICDEM.net, dsPICworks, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, Linear Active Thermistor, MPASM, MPLIB, MPLINK, MPSIM, PCKIT, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, rLAB, rPICDEM, Select Mode, Smart Serial, SmartTel, Total Endurance and WiperLock are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

**QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2002 ==**

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
