

## 1A Low-Dropout Regulator with Reverse Current Protection

### FEATURES

- **Stable with 1.0 $\mu$ F or Larger Ceramic Output Capacitor**
- **Input Voltage Range: 2.2V to 5.5V**
- **Ultra-Low Dropout Voltage: 130mV typ at 1A**
- **Excellent Load Transient Response—Even With Only 1.0 $\mu$ F Output Capacitor**
- **NMOS Topology Delivers Low Reverse Leakage Current**
- **1.0% Initial Accuracy**
- **3% Overall Accuracy Over Line, Load, and Temperature**
- **Less Than 20nA typical  $I_Q$  in Shutdown Mode**
- **Thermal Shutdown and Current Limit for Fault Protection**
- **Available in Multiple Output Voltage Versions**
  - Adjustable Output: 1.20V to 5.5V
  - Custom Outputs Available Using Factory Package-Level Programming

### APPLICATIONS

- **Point of Load Regulation for DSPs, FPGAs, ASICs, and Microprocessors**
- **Post-Regulation for Switching Supplies**
- **Portable/Battery-Powered Equipment**

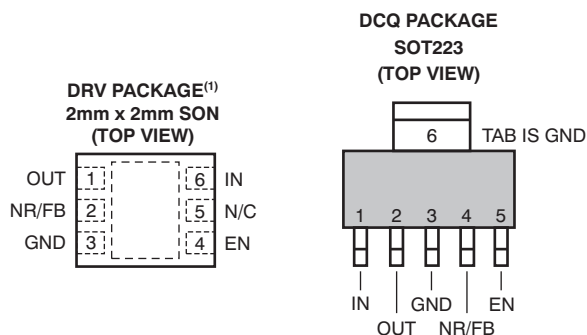

Typical Application Circuit

### DESCRIPTION

The TPS737xx family of linear low-dropout (LDO) voltage regulators uses an NMOS pass element in a voltage-follower configuration. This topology is relatively insensitive to output capacitor value and ESR, allowing a wide variety of load configurations. Load transient response is excellent, even with a small 1.0 $\mu$ F ceramic output capacitor. The NMOS topology also allows very low dropout.

The TPS737xx family uses an advanced BiCMOS process to yield high precision while delivering very low dropout voltages and low ground pin current. Current consumption, when not enabled, is under 20nA and ideal for portable applications. These devices are protected by thermal shutdown and foldback current limit.

(1) Power dissipation may limit operating range. Check [Thermal Information](#) table.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION<sup>(1)</sup>

PRODUCT	V <sub>OUT</sub> <sup>(2)</sup>
TPS737xx yy yz	<b>XX</b> is nominal output voltage (for example, 25 = 2.5V, 01 = Adjustable <sup>(3)</sup> ). <b>YYY</b> is package designator. <b>Z</b> is package quantity.

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder at [www.ti.com](http://www.ti.com).
- (2) Most output voltages of 1.25V and 1.3V to 5.0V in 100mV increments are available on a quick-turn basis using innovative factory package-level programming. Minimum order quantities apply; contact factory for details and availability.
- (3) For fixed 1.20V operation, tie FB to OUT.

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Over operating free-air temperature range unless otherwise noted.

PARAMETER	TPS737xx	UNIT
V <sub>IN</sub> range	–0.3 to +6.0	V
V <sub>EN</sub> range	–0.3 to +6.0	V
V <sub>OUT</sub> range	–0.3 to +5.5	V
V <sub>NR</sub> , V <sub>FB</sub> range	–0.3 to +6.0	V
Peak output current	Internally limited	
Output short-circuit duration	Indefinite	
Continuous total power dissipation	See <a href="#">Thermal Information</a> table	
Junction temperature range, T <sub>J</sub>	–55 to +150	°C
Storage temperature range	–65 to +150	°C
ESD rating, HBM	2	kV
ESD rating, CDM	500	V

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under the *Electrical Characteristics* is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

**THERMAL INFORMATION**

THERMAL METRIC <sup>(1)</sup>		TPS737xx <sup>(2)</sup>			UNITS
		DRB	DCQ	DRV <sup>(3)</sup>	
		8 PINS	6 PINS	6 PINS	
$\theta_{JA}$	Junction-to-ambient thermal resistance <sup>(4)</sup>	47.8	70.4	50.2	°C/W
$\theta_{JcTop}$	Junction-to-case (top) thermal resistance <sup>(5)</sup>	83	70	59	
$\theta_{JB}$	Junction-to-board thermal resistance <sup>(6)</sup>	N/A	N/A	N/A	
$\psi_{JT}$	Junction-to-top characterization parameter <sup>(7)</sup>	2.1	6.8	0.1	
$\psi_{JB}$	Junction-to-board characterization parameter <sup>(8)</sup>	17.8	30.1	30.1	
$\theta_{JcBot}$	Junction-to-case (bottom) thermal resistance <sup>(9)</sup>	12.1	6.3	8.3	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953A](#).
- (2) Thermal data for the DRB, DCQ, and DRV packages are derived by thermal simulations based on JEDEC-standard methodology as specified in the JESD51 series. The following assumptions are used in the simulations:
- DRB: The exposed pad is connected to the PCB ground layer through a 2x2 thermal via array.
  - DCQ: The exposed pad is connected to the PCB ground layer through a 3x2 thermal via array.
  - DRV: The exposed pad is connected to the PCB ground layer through a 2x2 thermal via array. Due to size limitation of thermal pad, 0.8-mm pitch array is used which is off the JEDEC standard.
- DRB: The top and bottom copper layers are assumed to have a 20% thermal conductivity of copper representing a 20% copper coverage.
  - DCQ: Each of top and bottom copper layers has a dedicated pattern for 20% copper coverage.
  - DRV: The top and bottom copper layers are assumed to have a 20% thermal conductivity of copper representing a 20% copper coverage.
- (c) These data were generated with only a single device at the center of a JEDEC high-K (2s2p) board with 3in × 3in copper area. To understand the effects of the copper area on thermal performance, see the [Power Dissipation](#) and [Estimating Junction Temperature](#) sections of this data sheet.
- Power dissipation may limit operating range.
  - The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
  - The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the top of the package. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
  - The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
  - The junction-to-top characterization parameter,  $\psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data to obtain  $\theta_{JA}$  using a procedure described in JESD51-2a (sections 6 and 7).
  - The junction-to-board characterization parameter,  $\psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data to obtain  $\theta_{JA}$  using a procedure described in JESD51-2a (sections 6 and 7).
  - The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## ELECTRICAL CHARACTERISTICS

Over operating temperature range ( $T_J = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ),  $V_{IN} = V_{OUT(nom)} + 1.0\text{V}^{(1)}$ ,  $I_{OUT} = 10\text{mA}$ ,  $V_{EN} = 2.2\text{V}$ , and  $C_{OUT} = 2.2\mu\text{F}$ , unless otherwise noted. Typical values are at  $T_J = +25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS	TPS737xx			UNIT

		$f = 10\text{kHz}$ , $I_{OUT} = 1\text{A}$		37			
$V_N$	Output noise voltage BW = 10Hz to 100kHz	$C_{OUT} = 10\mu\text{F}$		$27 \times V_{OUT}$		$\mu\text{V}_{RMS}$	
$t_{STR}$	Startup time	$V_{OUT} = 3\text{V}$ , $R_L = 30\Omega$ , $C_{OUT} = 1\mu\text{F}$		600		$\mu\text{s}$	
$V_{EN(HI)}$	EN pin high (enabled)		1.7		$V_{IN}$	V	
$V_{EN(LO)}$	EN pin low (shutdown)		0		0.5	V	
$I_{EN(HI)}$	EN pin current (enabled)	$V_{EN} = 5.5\text{V}$		20		nA	
$T_{SD}$	Thermal shutdown temperature	Shutdown, temperature increasing		+160		$^\circ\text{C}$	
		Reset, temperature decreasing		+140			
$T_J$	Operating junction temperature		-40		+125	$^\circ\text{C}$	

(1) Minimum  $V_{IN} = V_{OUT} + V_{DO}$  or  $2.2\text{V}$ , whichever is greater.

(2) For  $V_{OUT(nom)} < 1.6\text{V}$ , when  $V_{IN} \leq 1.6\text{V}$ , the output will lock to  $V_{IN}$  and may result in an over-voltage condition on the output. To avoid this situation, disable the device before powering down  $V_{IN}$ .

(3) TPS73701 is tested at  $V_{OUT} = 1.2\text{V}$ .

(4) Tolerance of external resistors not included in this specification.

(5)  $V_{DO}$  is not measured for fixed output versions with  $V_{OUT(nom)} < 2.3\text{V}$  since minimum  $V_{IN} = 2.2\text{V}$ .

(6) Fixed-voltage versions only; refer to the [Applications](#) section for more information.

FUNCTIONAL BLOCK DIAGRAMS

Figure 2. Adjustable Voltage Version

### PIN CONFIGURATIONS

(1) Power dissipation may limit operating range. Check [Thermal Information](#) table.

**Table 1. Pin Descriptions**

PIN NAME	SOT223 (DCQ) PIN NO.	3×3 SON (DRB) PIN NO.	2×2 SON (DRV) PIN NO.	DESCRIPTION
IN	1	8	6	Unregulated input supply
GND	3, 6	4, Pad	3, Pad	Ground
EN	5	5	4	Driving the enable pin (EN) high turns on the regulator. Driving this pin low puts the regulator into shutdown mode. Refer to the <a href="#">Shutdown</a> section under <a href="#">Applications Information</a> for more details. EN must not be left floating and can be connected to IN if not used.
NR	4	3	2	Fixed voltage versions only—connecting an external capacitor to this pin bypasses noise generated by the internal bandgap, reducing output noise to very low levels.
FB	4	3	2	Adjustable voltage version only—this is the input to the control loop error amplifier, and is used to set the output voltage of the device.
OUT	2	1	1	Regulator output. A 1.0µF or larger capacitor of any type is required for stability.
NC	—	2, 6, 7	5	Not connected

**TYPICAL CHARACTERISTICS**

For all voltage versions at  $T_J = +25^\circ\text{C}$ ,  $V_{IN} = V_{OUT(nom)} + 1.0\text{V}$ ,  $I_{OUT} = 10\text{mA}$ ,  $V_{EN} = 2.2\text{V}$ , and  $C_{OUT} = 2.2\mu\text{F}$ , unless otherwise noted.

## APPLICATION INFORMATION

The TPS737xx belongs to a family of new generation LDO regulators that use an NMOS pass transistor to achieve ultra-low-dropout performance, reverse current blockage, and freedom from output capacitor constraints. These features combined with an enable input make the TPS737xx ideal for portable applications. This regulator family offers a wide selection of fixed output voltage versions and an adjustable output version. All versions have thermal and over-current protection, including foldback current limit.

Figure 31 shows the basic circuit connections for the fixed voltage models. Figure 32 gives the connections for the adjustable output version (TPS73701).

**Figure 31. Typical Application Circuit for Fixed-Voltage Versions**

**Figure 32. Typical Application Circuit for Adjustable-Voltage Version**

$R_1$  and  $R_2$  can be calculated for any output voltage using the formula shown in Figure 32. Sample resistor values for common output voltages are shown in Figure 2.

For best accuracy, make the parallel combination of  $R_1$  and  $R_2$  approximately equal to 19k $\Omega$ . This 19k $\Omega$ ,

in addition to the internal 8k $\Omega$  resistor, presents the same impedance to the error amp as the 27k $\Omega$  bandgap reference output. This impedance helps compensate for leakages into the error amp terminals.

### INPUT AND OUTPUT CAPACITOR REQUIREMENTS

Although an input capacitor is not required for stability if input impedance is very low, it is good analog design practice to connect a 0.1 $\mu$ F to 1 $\mu$ F low equivalent series resistance (ESR) capacitor across the input supply near the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast rise-time load transients are anticipated or the device is located several inches from the power source.

The TPS737xx requires a 1.0 $\mu$ F output capacitor for stability. It is designed to be stable for all available types and values of capacitors. In applications where multiple low ESR capacitors are in parallel, ringing may occur when the product of  $C_{OUT}$  and total ESR drops below 50nF. Total ESR includes all parasitic resistances, including capacitor ESR and board, socket, and solder joint resistance. In most applications, the sum of capacitor ESR and trace resistance will meet this requirement.

### OUTPUT NOISE

A precision bandgap reference is used to generate the internal reference voltage,  $V_{REF}$ . This reference is the dominant noise source within the TPS737xx and it generates approximately 32 $\mu$ V $_{RMS}$  (10Hz to 100kHz) at the reference output (NR). The regulator control loop gains up the reference noise with the same gain as the reference voltage, so that the noise voltage of the regulator is approximately given by:

$$V_N = 32\mu V_{RMS} \times \frac{(R_1 + R_2)}{R_2} = 32\mu V_{RMS} \times \frac{V_{OUT}}{V_{REF}} \quad (1)$$

Since the value of  $V_{REF}$  is 1.2V, this relationship reduces to:

$$V_N(\mu V_{RMS}) = 27 \left( \frac{\mu V_{RMS}}{V} \right) \times V_{OUT} (V) \quad (2)$$

for the case of no  $C_{NR}$ .

An internal 27kΩ resistor in series with the noise reduction pin (NR) forms a low-pass filter for the voltage reference when an external noise reduction capacitor, C<sub>NR</sub>, is connected from NR to ground. For C<sub>NR</sub> = 10nF, the total noise in the 10Hz to 100kHz bandwidth is reduced by a factor of ~3.2, giving the approximate relationship:

$$V_N(\mu\text{V}_{\text{RMS}}) = 8.5 \left( \frac{\mu\text{V}_{\text{RMS}}}{\text{V}} \right) \times V_{\text{OUT}}(\text{V}) \quad (3)$$

for C<sub>NR</sub> = 10nF.

This noise reduction effect is shown as RMS Noise Voltage vs C<sub>NR</sub> in the [Typical Characteristics](#) section.

The TPS73701 adjustable version does not have the NR pin available. However, connecting a feedback capacitor, C<sub>FB</sub>, from the output to the feedback pin (FB) reduces output noise and improve load transient performance. This capacitor should be limited to 0.1μF.

The TPS737xx uses an internal charge pump to develop an internal supply voltage sufficient to drive the gate of the NMOS pass element above V<sub>OUT</sub>. The charge pump generates ~250μV of switching noise at ~4MHz; however, charge-pump noise contribution is negligible at the output of the regulator for most values of I<sub>OUT</sub> and C<sub>OUT</sub>.

## BOARD LAYOUT RECOMMENDATION TO IMPROVE PSRR AND NOISE PERFORMANCE

To improve ac performance such as PSRR, output noise, and transient response, it is recommended that the printed circuit board (PCB) be designed with separate ground planes for V<sub>IN</sub> and V<sub>OUT</sub>, with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the bypass capacitor should connect directly to the GND pin of the device.

## INTERNAL CURRENT LIMIT

The TPS737xx internal current limit helps protect the regulator during fault conditions. Foldback current limit helps to protect the regulator from damage during output short-circuit conditions by reducing current limit when V<sub>OUT</sub> drops below 0.5V. See [Figure 12](#) in the [Typical Characteristics](#) section.

Note from [Figure 12](#) that approximately –0.2V of V<sub>OUT</sub> results in a current limit of 0mA. Therefore, if OUT is forced below –0.2V before EN goes high, the device may not start up. In applications that work with both a positive and negative voltage supply, the TPS737xx should be enabled first.

## ENABLE PIN AND SHUTDOWN

The enable pin (EN) is active high and is compatible with standard TTL-CMOS levels. A V<sub>EN</sub> below 0.5V (max) turns the regulator off and drops the GND pin current to approximately 10nA. When EN is used to shutdown the regulator, all charge is removed from the pass transistor gate, and the output ramps back up to a regulated V<sub>OUT</sub> (see [Figure 23](#)).

When shutdown capability is not required, EN can be connected to V<sub>IN</sub>. However, the pass gate may not be discharged using this configuration, and the pass transistor may be left on (enhanced) for a significant time after V<sub>IN</sub> has been removed. This scenario can result in reverse current flow (if the IN pin is low impedance) and faster ramp times upon power-up. In addition, for V<sub>IN</sub> ramp times slower than a few milliseconds, the output may overshoot upon power-up.

Note that current limit foldback can prevent device start-up under some conditions. See the [Internal Current Limit](#) section for more information.

## DROPOUT VOLTAGE

The TPS737xx uses an NMOS pass transistor to achieve extremely low dropout. When (V<sub>IN</sub> – V<sub>OUT</sub>) is less than the dropout voltage (V<sub>DO</sub>), the NMOS pass device is in its linear region of operation and the input-to-output resistance is the R<sub>DS, ON</sub> of the NMOS pass element.

For large step changes in load current, the TPS737xx requires a larger voltage drop from V<sub>IN</sub> to V<sub>OUT</sub> to avoid degraded transient response. The boundary of this transient dropout region is approximately twice the dc dropout. Values of V<sub>IN</sub> – V<sub>OUT</sub> above this line ensure normal transient response.

Operating in the transient dropout region can cause an increase in recovery time. The time required to recover from a load transient is a function of the magnitude of the change in load current rate, the rate of change in load current, and the available headroom (V<sub>IN</sub> to V<sub>OUT</sub> voltage drop). Under worst-case conditions [full-scale instantaneous load change with (V<sub>IN</sub> – V<sub>OUT</sub>) close to dc dropout levels], the TPS737xx can take a couple of hundred microseconds to return to the specified regulation accuracy.

## TRANSIENT RESPONSE

The low open-loop output impedance provided by the NMOS pass element in a voltage follower configuration allows operation without a 1.0µF output capacitor. As with any regulator, the addition of additional capacitance from the OUT pin to ground reduces undershoot magnitude but increases its duration. In the adjustable version, the addition of a capacitor,  $C_{FB}$ , from the OUT pin to the FB pin will also improve the transient response.

The TPS737xx does not have active pull-down when the output is over-voltage. This architecture allows applications that connect higher voltage sources, such as alternate power supplies, to the output. This architecture also results in an output overshoot of several percent if the load current quickly drops to zero when a capacitor is connected to the output. The duration of overshoot can be reduced by adding a load resistor. The overshoot decays at a rate determined by output capacitor  $C_{OUT}$  and the internal/external load resistance. The rate of decay is given by:

(Fixed voltage version)

$$\frac{dV}{dT} = \frac{V_{OUT}}{C_{OUT} \times 80k\Omega \parallel R_{LOAD}} \quad (4)$$

(Adjustable voltage version)

$$\frac{dV}{dT} = \frac{V_{OUT}}{C_{OUT} \times 80k\Omega \parallel (R_1 + R_2) \parallel R_{LOAD}} \quad (5)$$

## REVERSE CURRENT

The NMOS pass element of the TPS737xx provides inherent protection against current flow from the output of the regulator to the input when the gate of the pass device is pulled low. To ensure that all charge is removed from the gate of the pass element, the EN pin must be driven low before the input voltage is removed. If this is not done, the pass element may be left on because of stored charge on the gate.

After the EN pin is driven low, no bias voltage is needed on any pin for reverse current blocking. Note that reverse current is specified as the current flowing out of the IN pin because of voltage applied on the OUT pin. There will be additional current flowing into the OUT pin as a result of the 80kΩ internal resistor divider to ground (see [Figure 1](#) and [Figure 2](#)).

For the TPS73701, reverse current may flow when  $V_{FB}$  is more than 1.0V above  $V_{IN}$ .

## THERMAL PROTECTION

Thermal protection disables the output when the junction temperature rises to approximately +160°C, allowing the device to cool. When the junction temperature cools to approximately +140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage due to overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to +125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least +35°C above the maximum expected ambient condition of your application. This produces a worst-case junction temperature of +125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS737xx has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS737xx into thermal shutdown degrades device reliability.

## POWER DISSIPATION

Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the tab or pad is critical to avoiding thermal shutdown and ensuring reliable operation.

Power dissipation of the device depends on input voltage and load conditions and can be calculated using Equation 6:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (6)$$

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On both SON (DRB) and SON (DRV) packages, the primary conduction path for heat is through the exposed pad to the printed circuit board (PCB). The pad can be connected to ground or be left floating; however, it should be attached to an appropriate amount of copper PCB area to ensure the device does not overheat. On the SOT-223 (DCQ) package, the primary conduction path for heat is through the tab to the PCB. That tab should be connected to ground. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device and can be calculated using Equation 7:

$$R_{\theta JA} = \frac{(+125^{\circ}\text{C} - T_A)}{P_D} \quad (7)$$

Knowing the maximum  $R_{\theta JA}$ , the minimum amount of PCB copper area needed for appropriate heatsinking can be estimated using Figure 33.

Note:  $\theta_{JA}$  value at board size of 9in<sup>2</sup> (that is, 3in × 3in) is a JEDEC standard.

**Figure 33.  $\theta_{JA}$  vs Board Size**

Figure 33 shows the variation of  $\theta_{JA}$  as a function of ground plane copper area in the board. It is intended only as a guideline to demonstrate the effects of heat spreading in the ground plane and should not be used to estimate actual thermal performance in real application environments.

**NOTE:** When the device is mounted on an application PCB, it is strongly recommended to use  $\Psi_{JT}$  and  $\Psi_{JB}$ , as explained in the *Estimating Junction Temperature* section.

### ESTIMATING JUNCTION TEMPERATURE

Using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , as shown in the [Thermal Information](#) table, the junction temperature can be estimated with corresponding formulas (given in [Equation 8](#)). For backwards compatibility, an older  $\theta_{JC,Top}$  parameter is listed as well.

$$\Psi_{JT}: T_J = T_T + \Psi_{JT} \cdot P_D$$

$$\Psi_{JB}: T_J = T_B + \Psi_{JB} \cdot P_D \tag{8}$$

Where  $P_D$  is the power dissipation shown by [Equation 6](#),  $T_T$  is the temperature at the center-top of the IC package, and  $T_B$  is the PCB temperature measured 1mm away from the IC package *on the PCB surface* (as [Figure 35](#) shows).

**NOTE:** Both  $T_T$  and  $T_B$  can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring  $T_T$  and  $T_B$ , see the application note [SBVA025, Using New Thermal Metrics](#), available for download at [www.ti.com](#).

By looking at [Figure 34](#), the new thermal metrics ( $\Psi_{JT}$  and  $\Psi_{JB}$ ) have very little dependency on board size. That is, using  $\Psi_{JT}$  or  $\Psi_{JB}$  with [Equation 8](#) is a good way to estimate  $T_J$  by simply measuring  $T_T$  or  $T_B$ , regardless of the application board size.

Figure 34.  $\Psi_{JT}$  and  $\Psi_{JB}$  vs Board Size

For a more detailed discussion of why TI does not recommend using  $\theta_{JC(top)}$  to determine thermal characteristics, refer to application report [SBVA025, Using New Thermal Metrics](#), available for download at [www.ti.com](#). For further information, refer to application report [SPRA953, IC Package Thermal Metrics](#), also available on the TI website.

(1) Power dissipation may limit operating range. Check [Thermal Information](#) table.

Figure 35. Measuring Points for  $T_T$  and  $T_B$

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision M (October, 2010) to Revision N</b>	<b>Page</b>
• Added footnote (3) to <i>Thermal Information</i> table .....	4
• Added footnote to <a href="#">Figure 35</a> .....	16
<b>Changes from Revision L (August, 2010) to Revision M</b>	<b>Page</b>
• Corrected typo in <a href="#">Figure 35</a> .....	16

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC SMALL-OUTLINE

4202109/D 06/09

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - C. Controlling dimension in inches.
  - $\triangle D$  Body length and width dimensions are determined at the outermost extremes of the plastic body exclusive of mold flash, tie bar burrs, gate burrs, and interlead flash, but including any mismatch between the top and the bottom of the plastic body.
  - $\triangle E$  Lead width dimension does not include dambar protrusion.
  - $\triangle F$  Lead width and thickness dimensions apply to solder plated leads.
  - G. Interlead flash allow 0.008 inch max.
  - H. Gate burr/protrusion max. 0.006 inch.
  - I. Datums A and B are to be determined at Datum H.

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-SM-782 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
  - Please refer to the product data sheet for specific via and thermal dissipation requirements.

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Small Outline No-Lead (SON) package configuration.
  - Ⓜ The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - Ⓜ See the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

# THERMAL PAD MECHANICAL DATA

DRB (S-PVSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
