  - I/O Timing
  - Internal Logic Timing
  - DCM Timing
  - Configuration and JTAG Timing

**Module 4:  
Pinout Descriptions****DS099-4 (v2.1) April 26, 2006**

- Pin Descriptions
  - Pin Behavior During Configuration
- Package Overview
- Pinout Tables
  - Footprints

**IMPORTANT NOTE:** *Each module has its own Revision History at the end. Use the PDF "Bookmarks" for easy navigation in this volume.*

## Introduction

The Spartan™-3 family of Field-Programmable Gate Arrays is specifically designed to meet the needs of high volume, cost-sensitive consumer electronic applications. The eight-member family offers densities ranging from 50,000 to five million system gates, as shown in [Table 1](#).

The Spartan-3 family builds on the success of the earlier Spartan-II family by increasing the amount of logic resources, the capacity of internal RAM, the total number of I/Os, and the overall level of performance as well as by improving clock management functions. Numerous enhancements derive from state-of-the-art Virtex™-II technology. These Spartan-3 enhancements, combined with advanced process technology, deliver more functionality and bandwidth per dollar than was previously possible, setting new standards in the programmable logic industry.

Because of their exceptionally low cost, Spartan-3 FPGAs are ideally suited to a wide range of consumer electronics applications, including broadband access, home networking, display/projection and digital television equipment.

The Spartan-3 family is a superior alternative to mask programmed ASICs. FPGAs avoid the high initial cost, the lengthy development cycles, and the inherent inflexibility of conventional ASICs. Also, FPGA programmability permits design upgrades in the field with no hardware replacement necessary, an impossibility with ASICs.

## Features

- Low-cost, high-performance logic solution for high-volume, consumer-oriented applications
  - Densities up to 74,880 logic cells
- SelectIO™ signaling
  - Up to 784 I/O pins
  - 622 Mb/s data transfer rate per I/O
  - 18 single-ended signal standards
  - 8 differential I/O standards including LVDS, RSFS
  - Termination by Digitally Controlled Impedance
  - Signal swing ranging from 1.14V to 3.45V
  - Double Data Rate (DDR) support
  - [DDR, DDR2 SDRAM support](#) up to 333 Mbps
- Logic resources
  - Abundant logic cells with shift register capability
  - Wide, fast multiplexers
  - Fast look-ahead carry logic
  - Dedicated 18 x 18 multipliers
  - JTAG logic compatible with IEEE 1149.1/1532
- SelectRAM™ hierarchical memory
  - Up to 1,872 Kbits of total block RAM
  - Up to 520 Kbits of total distributed RAM
- Digital Clock Manager (up to four DCMs)
  - Clock skew elimination
  - Frequency synthesis
  - High resolution phase shifting
- Eight global clock lines and abundant routing
- Fully supported by [Xilinx ISE and WebPACK](#) development systems
- [MicroBlaze™](#) and [PicoBlaze™](#) processor, [PCI](#), [PCI Express PIPE endpoint](#), and other [IP cores](#)
- Pb-free packaging options
- Automotive [Spartan-3 XA Family](#) variant

Table 1: Summary of Spartan-3 FPGA Attributes

Device	System Gates	Equivalent Logic Cells <sup>1</sup>	CLB Array (One CLB = Four Slices)			Distributed RAM Bits (K=1024)	Block RAM Bits (K=1024)	Dedicated Multipliers	DCMs	Maximum User I/O	Maximum Differential I/O Pairs

XC3S2000	2M	46,080	80	64	5,120	320K	720K	40	4	565	270
XC3S4000	4M	62,208	96	72	6,912	432K	1,728K	96	4	712	312
XC3S5000	5M	74,880	104	80	8,320	520K	1,872K	104	4	784	344

**Notes:**

1. Logic Cell = 4-input Look-Up Table (LUT) plus a 'D' flip-flop. "Equivalent Logic Cells" equals "Total CLBs" x 8 Logic Cells/CLB x 1.125 effectiveness.
2. These devices are available in Xilinx Automotive versions as described in [DS314](#): Spartan-3 Automotive XA FPGA Family.

## Architectural Overview

The Spartan-3 family architecture consists of five fundamental programmable functional elements:

- Configurable Logic Blocks (CLBs) contain RAM-based Look-Up Tables (LUTs) to implement logic and storage elements that can be used as flip-flops or latches. CLBs can be programmed to perform a wide variety of logical functions as well as to store data.
- Input/Output Blocks (IOBs) control the flow of data between the I/O pins and the internal logic of the device. Each IOB supports bidirectional data flow plus 3-state operation. Twenty-six different signal standards, including eight high-performance differential standards, are available as shown in [Table 2](#). Double Data-Rate (DDR) registers are included. The Digitally Controlled Impedance (DCI) feature provides automatic on-chip terminations, simplifying board designs.
- Block RAM provides data storage in the form of 18-Kbit dual-port blocks.
- Multiplier blocks accept two 18-bit binary numbers as inputs and calculate the product.

- Digital Clock Manager (DCM) blocks provide self-calibrating, fully digital solutions for distributing, delaying, multiplying, dividing, and phase shifting clock signals.

These elements are organized as shown in [Figure 1](#). A ring of IOBs surrounds a regular array of CLBs. The XC3S50 has a single column of block RAM embedded in the array. Those devices ranging from the XC3S200 to the XC3S2000 have two columns of block RAM. The XC3S4000 and XC3S5000 devices have four RAM columns. Each column is made up of several 18-Kbit RAM blocks; each block is associated with a dedicated multiplier. The DCMs are positioned at the ends of the outer block RAM columns.

The Spartan-3 family features a rich network of traces and switches that interconnect all five functional elements, transmitting signals among them. Each functional element has an associated switch matrix that permits multiple connections to the routing.

### Notes:

1. The two additional block RAM columns of the XC3S4000 and XC3S5000 devices are shown with dashed lines. The XC3S50 has only the block RAM column on the far left.

Figure 1: Spartan-3 Family Architecture

## Configuration

Spartan-3 FPGAs are programmed by loading configuration data into robust, reprogrammable, static CMOS configuration latches (CCLs) that collectively control all functional elements and routing resources. Before powering on the FPGA, configuration data is stored externally in a PROM or some other nonvolatile medium either on or off the board. After applying power, the configuration data is written to the FPGA using any of five different modes: Master Parallel, Slave Parallel, Master Serial, Slave Serial, and Boundary Scan (JTAG). The Master and Slave Parallel modes use an 8-bit wide SelectMAP™ port.

The recommended memory for storing the configuration data is the low-cost Xilinx Platform Flash PROM family, which includes the XCF00S PROMs for serial configuration and the higher density XCF00P PROMs for parallel or serial configuration.

## I/O Capabilities

The SelectIO feature of Spartan-3 devices supports 18 single-ended standards and 8 differential standards as listed in [Table 2](#). Many standards support the DCI feature, which uses integrated terminations to eliminate unwanted signal reflections. [Table 3](#) shows the number of user I/Os as well as the number of differential I/O pairs available for each device/package combination.

Table 2: Signal Standards Supported by the Spartan-3 Family

Standard Category	Description	V <sub>CCO</sub> (V)	Class	Symbol (IOSTANDARD)	DCI Option
<b>Single-Ended</b>					
GTL	Gunning Transceiver Logic	N/A	Terminated	GTL	Yes
			Plus	GTLP	Yes
HSTL	High-Speed Transceiver Logic	1.5	I	HSTL_I	Yes
			III	HSTL_III	Yes
			I	HSTL_I_18	Yes
		1.8	II	HSTL_II_18	Yes
			III	HSTL_III_18	Yes
LVCMOS	Low-Voltage CMOS	1.2	N/A	LVCMOS12	No
		1.5	N/A	LVCMOS15	Yes
		1.8	N/A	LVCMOS18	Yes
		2.5	N/A	LVCMOS25	Yes
		3.3	N/A	LVCMOS33	Yes
LVTTTL	Low-Voltage Transistor-Transistor Logic	3.3	N/A	LVTTTL	No
PCI	Peripheral Component Interconnect	3.0	33 MHz	PCI33_3	No
SSTL	Stub Series Terminated Logic	1.8	N/A (±6.7 mA)	SSTL18_I	Yes
			N/A (±13.4 mA)	SSTL18_II	No
		2.5	I	SSTL2_I	Yes
			II	SSTL2_II	Yes
<b>Differential</b>					
LDT (ULVDS)	Lightning Data Transport (HyperTransport™) Logic	2.5	N/A	LDT_25	No

XC3S5000	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	633	300	784	344

**Notes:**

1. All device options listed in a given package column are pin-compatible.
2. User = Single-ended user I/O pins. Diff = Differential I/O pairs.

## Package Marking

Figure 2 shows the top marking for Spartan-3 FPGAs in the quad-flat packages. Figure 3 shows the top marking for Spartan-3 FPGAs in BGA packages except the 132-ball chip-scale package (CP132 and CPG132). The markings for the BGA packages are nearly identical to those for the quad-flat packages, except that the marking is rotated with

respect to the ball A1 indicator. Figure 4 shows the top marking for Spartan-3 FPGAs in the CP132 and CPG132 packages. Using the seven digits of the Lot Code, look up additional information for a specific device using the [Xilinx Genealogy Viewer](#).

Figure 2: Spartan-3 QFP Package Marking Example for Part Number XC3S400-4PQ208C

Figure 3: Spartan-3 BGA Package Marking Example for Part Number XC3S1000-4FT256C

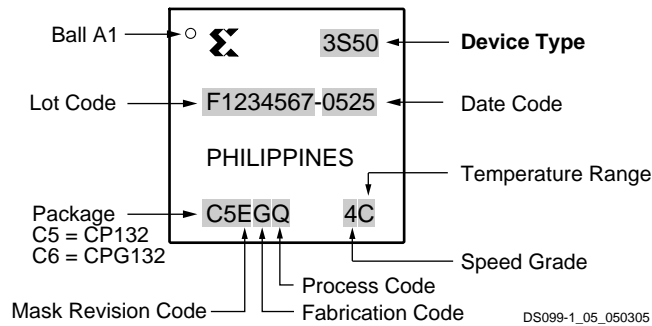

Figure 4: Spartan-3 CP132 and CPG132 Package Marking Example for XC3S50-4CP132C

## Ordering Information

Spartan-3 FPGAs are available in both standard and Pb-free packaging options for all device/package combinations. The Pb-free packages include a special 'G' character in the ordering code.

### Standard Packaging

### Pb-Free Packaging

For additional information on Pb-free packaging, see [XAPP427](#): "Implementation and Solder Reflow Guidelines for Pb-Free Packages".

Device	Speed Grade	Package Type / Number of Pins		Temperature Range ( $T_j$ )	
XC3S50	-4 Standard Performance	VQ(G)100	100-pin Very Thin Quad Flat Pack (VQFP)	C	Commercial ( $0^\circ\text{C}$ to $85^\circ\text{C}$ )
XC3S200	-5 High Performance <sup>1</sup>	CP(G)132	132-pin Chip-Scale Package (CSP)	I	Industrial ( $-40^\circ\text{C}$ to $100^\circ\text{C}$ )
XC3S400		TQ(G)144	144-pin Thin Quad Flat Pack (TQFP)		
XC3S1000		PQ(G)208	208-pin Plastic Quad Flat Pack (PQFP)		
XC3S1500		FT(G)256	256-ball Fine-Pitch Thin Ball Grid Array (FTBGA)		
XC3S2000		FG(G)320	320-ball Fine-Pitch Ball Grid Array (FBGA)		
XC3S4000		FG(G)456	456-ball Fine-Pitch Ball Grid Array (FBGA)		
XC3S5000		FG(G)676	676-ball Fine-Pitch Ball Grid Array (FBGA)		
		FG(G)900	900-ball Fine-Pitch Ball Grid Array (FBGA)		
		FG(G)1156	1156-ball Fine-Pitch Ball Grid Array (FBGA)		

#### Notes:

1. The -5 speed grade is exclusively available in the Commercial temperature range.

## Revision History

Date	Version No.	Description
04/11/03	1.0	Initial Xilinx release.
04/24/03	1.1	Updated block RAM, DCM, and multiplier counts for the XC3S50.
12/24/03	1.2	Added the FG320 package.
07/13/04	1.3	Added information on Pb-free packaging options.
01/17/05	1.4	Referenced Spartan-3L Low Power FPGA and Spartan-3 XA Automotive FPGA families in <a href="#">Table 1</a> . Added XC3S50CP132, XC3S2000FG456, XC3S4000FG676 options to <a href="#">Table 3</a> . Updated <b>Package Marking</b> to show mask revision code, fabrication facility code, and process technology code.
08/19/05	1.5	Added package markings for BGA packages ( <a href="#">Figure 3</a> ) and CP132/CPG132 packages ( <a href="#">Figure 4</a> ). Added differential (complementary single-ended) HSTL and SSTL I/O standards.
04/03/06	2.0	Increased number of supported single-ended and differential I/O standards.
04/26/06	2.1	Updated document links.

---

## The Spartan-3 Generation FPGA Family

DS312, [Spartan-3E FPGA Family](#)

DS314-1, [Spartan-3 XA Automotive FPGA Family](#)

## IOBs

### IOB Overview

The Input/Output Block (IOB) provides a programmable, bidirectional interface between an I/O pin and the FPGA's internal logic.

A simplified diagram of the IOB's internal structure appears in [Figure 5](#). There are three main signal paths within the IOB: the output path, input path, and 3-state path. Each path has its own pair of storage elements that can act as either registers or latches. For more information, see the [Storage Element Functions](#) section. The three main signal paths are as follows:

- The input path carries data from the pad, which is bonded to a package pin, through an optional programmable delay element directly to the I line. There are alternate routes through a pair of storage elements to the IQ1 and IQ2 lines. The IOB outputs I, IQ1, and IQ2 all lead to the FPGA's internal logic. The delay element can be set to ensure a hold time of zero.
- The output path, starting with the O1 and O2 lines, carries data from the FPGA's internal logic through a multiplexer and then a three-state driver to the IOB pad. In addition to this direct path, the multiplexer provides the option to insert a pair of storage elements.
- The 3-state path determines when the output driver is high impedance. The T1 and T2 lines carry data from the FPGA's internal logic through a multiplexer to the output driver. In addition to this direct path, the

multiplexer provides the option to insert a pair of storage elements. When the T1 or T2 lines are asserted High, the output driver is high-impedance (floating, Hi-Z). The output driver is active-Low enabled.

- All signal paths entering the IOB, including those associated with the storage elements, have an inverter option. Any inverter placed on these paths is automatically absorbed into the IOB.

### Storage Element Functions

There are three pairs of storage elements in each IOB, one pair for each of the three paths. It is possible to configure each of these storage elements as an edge-triggered D-type flip-flop (FD) or a level-sensitive latch (LD).

The storage-element-pair on either the Output path or the Three-State path can be used together with a special multiplexer to produce Double-Data-Rate (DDR) transmission. This is accomplished by taking data synchronized to the clock signal's rising edge and converting them to bits synchronized on both the rising and the falling edge. The combination of two registers and a multiplexer is referred to as a Double-Data-Rate D-type flip-flop (FDDR).

See [Double-Data-Rate Transmission](#), page 13 for more information.

The signal paths associated with the storage element are described in [Table 4](#).

Table 4: Storage Element Signal Description

Storage Element Signal	Description	Function
D	Data input	Data at this input is stored on the active edge of CK enabled by CE. For latch operation when the input is enabled, data passes directly to the output Q.
Q	Data output	The data on this output reflects the state of the storage element. For operation as a latch in transparent mode, Q will mirror the data at D.
CK	Clock input	A signal's active edge on this input with CE asserted, loads data into the storage element.
CE	Clock Enable input	When asserted, this input enables CK. If not connected, CE defaults to the asserted state.
SR	Set/Reset	Forces storage element into the state specified by the SRHIGH/SRLow attributes. The SYNC/ASync attribute setting determines if the SR input is synchronized to the clock or not.
REV	Reverse	Used together with SR. Forces storage element into the state opposite from what SR does.

**Note:** All IOB signals originating from the FPGA's internal logic have an optional polarity inverter.

DS099-2\_01\_112905

**Figure 5: Simplified IOB Diagram**

According to **Figure 5**, the clock line OTCLK1 connects the CK inputs of the upper registers on the output and three-state paths. Similarly, OTCLK2 connects the CK inputs for the lower registers on the output and three-state paths. The upper and lower registers on the input path have independent clock lines: ICLK1 and ICLK2.

The enable line OCE connects the CE inputs of the upper and lower registers on the output path. Similarly, TCE connects the CE inputs for the register pair on the three-state

path and ICE does the same for the register pair on the input path.

The Set/Reset (SR) line entering the IOB is common to all six registers, as is the Reverse (REV) line.

Each storage element supports numerous options in addition to the control over signal polarity described in the IOB Overview section. These are described in **Table 5**.

**Table 5: Storage Element Options**

Option Switch	Function	Specificity
FF/Latch	Chooses between an edge-sensitive flip-flop or a level-sensitive latch	Independent for each storage element.
SYNC/ASYN	Determines whether SR is synchronous or asynchronous	Independent for each storage element.
SRHIGH/SRLOW	Determines whether SR acts as a Set, which forces the storage element to a logic "1" (SRHIGH) or a Reset, which forces a logic "0" (SRLOW).	Independent for each storage element, except when using FDDR. In the latter case, the selection for the upper element (OFF1 or TFF2) applies to both elements.
INIT1/INIT0	In the event of a Global Set/Reset, after configuration or upon activation of the GSR net, this switch decides whether to set or reset a storage element. By default, choosing SRLOW also selects INIT0; choosing SRHIGH also selects INIT1.	Independent for each storage element, except when using FDDR. In the latter case, selecting INIT0 for one element applies to both elements (even though INIT1 is selected for the other).

### Double-Data-Rate Transmission

Double-Data-Rate (DDR) transmission describes the technique of synchronizing signals to both the rising and falling edges of the clock signal. Spartan-3 devices use register-pairs in all three IOB paths to perform DDR operations.

The pair of storage elements on the IOB's Output path (OFF1 and OFF2), used as registers, combine with a special multiplexer to form a DDR D-type flip-flop (FDDR). This primitive permits DDR transmission where output data bits are synchronized to both the rising and falling edges of a clock. It is possible to access this function by placing either an FDDRSE or an FDDRCPE component or symbol into the design. DDR operation requires two clock signals (50% duty cycle), one the inverted form of the other. These signals trigger the two registers in alternating fashion, as shown in **Figure 6**. Commonly, the Digital Clock Manager (DCM) generates the two clock signals by mirroring an incoming signal, then shifting it 180 degrees. This approach ensures minimal skew between the two signals.

The storage-element-pair on the Three-State path (TFF1 and TFF2) can also be combined with a local multiplexer to form an FDDR primitive. This permits synchronizing the out-

put enable to both the rising and falling edges of a clock. This DDR operation is realized in the same way as for the output path.

The storage-element-pair on the input path (IFF1 and IFF2) allows an I/O to receive a DDR signal. An incoming DDR clock signal triggers one register and the inverted clock signal triggers the other register. In this way, the registers take turns capturing bits of the incoming DDR data signal.

Aside from high bandwidth data transfers, DDR can also be used to reproduce, or "mirror", a clock signal on the output. This approach is used to transmit clock and data signals together. A similar approach is used to reproduce a clock signal at multiple outputs. The advantage for both approaches is that skew across the outputs will be minimal.

Some adjacent I/O blocks (IOBs) share common routing connecting the ICLK1, ICLK2, OTCLK1, and OTCLK2 clock inputs of both IOBs. These IOB pairs are identified by their differential pair names IO\_LxxN\_# and IO\_LxxP\_#, where "xx" is an I/O pair number and '#' is an I/O bank number. Two adjacent IOBs containing DDR registers must share common clock inputs, otherwise one or more of the clock signals will be unroutable.

Figure 6: Clocking the DDR Register

## Pull-Up and Pull-Down Resistors

The optional pull-up and pull-down resistors are intended to establish High and Low levels, respectively, at unused I/Os. The pull-up resistor optionally connects each IOB pad to  $V_{CC0}$ . A pull-down resistor optionally connects each pad to GND. These resistors are placed in a design using the PULLUP and PULLDOWN symbols in a schematic, respectively. They can also be instantiated as components, set as constraints or passed as attributes in HDL code. These resistors can also be selected for all unused I/O using the Bitstream Generator (BitGen) option UnusedPin. A Low logic level on HSWAP\_EN activates the pull-up resistors on all I/Os during configuration.

The Spartan-3 I/O pull-up and pull-down resistors are significantly stronger than the "weak" pull-up/pull-down resistors used in previous Xilinx FPGA families. See [Table 32, page 56](#) for equivalent resistor strengths.

## Keeper Circuit

Each I/O has an optional keeper circuit that retains the last logic level on a line after all drivers have been turned off. This is useful to keep bus lines from floating when all connected drivers are in a high-impedance state. This function is placed in a design using the KEEPER symbol. Pull-up and pull-down resistors override the keeper circuit.

## ESD Protection

Clamp diodes protect all device pads against damage from Electro-Static Discharge (ESD) as well as excessive voltage

transients. Each I/O has two clamp diodes: One diode extends P-to-N from the pad to  $V_{CC0}$  and a second diode extends N-to-P from the pad to GND. During operation, these diodes are normally biased in the off state. These clamp diodes are always connected to the pad, regardless of the signal standard selected. The presence of diodes limits the ability of Spartan-3 I/Os to tolerate high signal voltages. The  $V_{IN}$  absolute maximum rating in [Table 27, page 53](#) specifies the voltage range that I/Os can tolerate.

## Slew Rate Control and Drive Strength

Two options, FAST and SLOW, control the output slew rate. The FAST option supports output switching at a high rate. The SLOW option reduces bus transients. These options are only available when using one of the LVCMOS or LVTTTL standards, which also provide up to seven different levels of current drive strength: 2, 4, 6, 8, 12, 16, and 24 mA. Choosing the appropriate drive strength level is yet another means to minimize bus transients.

[Table 6](#) shows the drive strengths that the LVCMOS and LVTTTL standards support.

Table 6: Programmable Output Drive Current

Signal Standard (IOSTANDARD)	Current Drive (mA)						
	2	4	6	8	12	16	24
LVTTTL	✓	✓	✓	✓	✓	✓	✓
LVCMOS33	✓	✓	✓	✓	✓	✓	✓
LVCMOS25	✓	✓	✓	✓	✓	✓	✓
LVCMOS18	✓	✓	✓	✓	✓	✓	-
LVCMOS15	✓	✓	✓	✓	✓	-	-
LVCMOS12	✓	✓	✓	-	-	-	-

## Boundary-Scan Capability

All Spartan-3 IOBs support boundary-scan testing compatible with IEEE 1149.1 standards. See [Boundary-Scan \(JTAG\) Mode, page 47](#) for more information.

## SelectIO Signal Standards

The IOBs support 18 different single-ended signal standards, as listed in [Table 7](#). Furthermore, the majority of IOBs can be used in specific pairs supporting any of eight differential signal standards, as shown in [Table 8](#).

To define the I/O signaling standard in a design, set the IOSTANDARD attribute to the appropriate setting. Xilinx provides a variety of different methods for applying the IOSTANDARD for maximum flexibility. For a full description of different methods of applying attributes to control IOSTANDARD, refer to ["Entry Strategies for Xilinx Constraints"](#).

Together with placing the appropriate I/O symbol, two externally applied voltage levels,  $V_{CC0}$  and  $V_{REF}$  select the desired signal standard. The  $V_{CC0}$  lines provide current to the output driver. The voltage on these lines determines the

output voltage swing for all standards except GTL and GTLP.

All single-ended standards except the LVCMOS, LVTTTL, and PCI varieties require a Reference Voltage ( $V_{REF}$ ) to bias the input-switching threshold. Once a configuration data file is loaded into the FPGA that calls for the I/Os of a given bank to use such a signal standard, a few specifically reserved I/O pins on the same bank automatically convert to  $V_{REF}$  inputs. When using one of the LVCMOS standards, these pins remain I/Os because the  $V_{CCO}$  voltage biases the input-switching threshold, so there is no need for  $V_{REF}$ . Select the  $V_{CCO}$  and  $V_{REF}$  levels to suit the desired single-ended standard according to [Table 7](#).

**Table 7: Single-Ended I/O Standards (Values in Volts)**

Signal Standard (IOSTANDARD)	$V_{CCO}$		$V_{REF}$ for Inputs <sup>(1)</sup>	Board Termination Voltage ( $V_{TT}$ )
	For Outputs	For Inputs		
GTL	Note 2	Note 2	0.8	1.2
GTLP	Note 2	Note 2	1	1.5
HSTL_I	1.5	-	0.75	0.75
HSTL_III	1.5	-	0.9	1.5
HSTL_I_18	1.8	-	0.9	0.9
HSTL_II_18	1.8	-	0.9	0.9
HSTL_III_18	1.8	-	1.1	1.8
LVCMOS12	1.2	1.2	-	-
LVCMOS15	1.5	1.5	-	-
LVCMOS18	1.8	1.8	-	-
LVCMOS25	2.5	2.5	-	-
LVCMOS33	3.3	3.3	-	-
LVTTTL	3.3	3.3	-	-
PCI33_3	3.0	3.0	-	-
SSTL18_I	1.8	-	0.9	0.9
SSTL18_II	1.8	-	0.9	0.9
SSTL2_I	2.5	-	1.25	1.25
SSTL2_II	2.5	-	1.25	1.25

**Notes:**

1. Banks 4 and 5 of any Spartan-3 device in a VQ100 package do not support signal standards using  $V_{REF}$ .
2. The  $V_{CCO}$  level used for the GTL and GTLP standards must be no lower than the termination voltage ( $V_{TT}$ ), nor can it be lower than the voltage at the I/O pad.
3. See [Table 9](#) for a listing of the single-ended DCI standards.

Differential standards employ a pair of signals, one the opposite polarity of the other. The noise canceling (e.g., Common-Mode Rejection) properties of these standards permit exceptionally high data transfer rates. This section introduces the differential signaling capabilities of Spartan-3 devices.

Each device-package combination designates specific I/O pairs that are specially optimized to support differential standards. A unique “L-number”, part of the pin name, identifies the line-pairs associated with each bank (see [Figure 38, page 103](#)). For each pair, the letters ‘P’ and ‘N’ designate the true and inverted lines, respectively. For example, the pin names IO\_L43P\_7 and IO\_L43N\_7 indicate the true and inverted lines comprising the line pair L43 on Bank 7. The  $V_{CCO}$  lines provide current to the outputs. The  $V_{CCAUX}$  lines supply power to the differential inputs, making them independent of the  $V_{CCO}$  voltage for an I/O bank. The  $V_{REF}$  lines are not used. Select the  $V_{CCO}$  level to suit the desired differential standard according to [Table 8](#).

**Table 8: Differential I/O Standards**

Signal Standard (IOSTANDARD)	$V_{CCO}$ (Volts)		$V_{REF}$ for Inputs (Volts)
	For Outputs	For Inputs	
LDT_25 (ULVDS_25)	2.5	-	-
LVDS_25	2.5	-	-
BLVDS_25	2.5	-	-
LVDSSEXT_25	2.5	-	-
LVPECL_25	2.5	-	-
RSDS_25	2.5	-	-
DIFF_HSTL_II_18	1.8	-	-
DIFF_SSTL2_II	2.5	-	-

**Notes:**

1. See [Table 9](#) for a listing of the differential DCI standards.

The need to supply  $V_{REF}$  and  $V_{CCO}$  imposes constraints on which standards can be used in the same bank. See [The Organization of IOBs into Banks](#) section for additional guidelines concerning the use of the  $V_{CCO}$  and  $V_{REF}$  lines.

### Digitally Controlled Impedance (DCI)

When the round-trip delay of an output signal — i.e., from output to input and back again — exceeds rise and fall times, it is common practice to add termination resistors to the line carrying the signal. These resistors effectively match the impedance of a device’s I/O to the characteristic impedance of the transmission line, thereby preventing reflections that adversely affect signal integrity. However, with the high I/O counts supported by modern devices, adding resistors requires significantly more components and board area. Furthermore, for some packages — e.g., ball grid arrays — it may not always be possible to place resistors close to pins.

DCI answers these concerns by providing two kinds of on-chip terminations: Parallel terminations make use of an integrated resistor network. Series terminations result from controlling the impedance of output drivers. DCI actively adjusts both parallel and series terminations to accurately match the characteristic impedance of the transmission line. This adjustment process compensates for differences in I/O

impedance that can result from normal variation in the ambient temperature, the supply voltage and the manufacturing process. When the output driver turns off, the series termination, by definition, approaches a very high impedance; in contrast, parallel termination resistors remain at the targeted values.

DCI is available only for certain I/O standards, as listed in [Table 9](#). DCI is selected by applying the appropriate I/O standard extensions to symbols or components. There are five basic ways to configure terminations, as shown in

[Table 10](#). The DCI I/O standard determines which of these terminations is put into effect.

HSTL\_I\_DCI-, HSTL\_III\_DCI-, and SSTL2\_I\_DCI-type outputs do not require the VRN and VRP reference resistors. Likewise, LVDCI-type inputs do not require the VRN and VRP reference resistors. In a bank without any DCI I/O or a bank containing non-DCI I/O and purely HSTL\_I\_DCI- or HSTL\_III\_DCI-type outputs, or SSTL2\_I\_DCI-type outputs or LVDCI-type inputs, the associated VRN and VRP pins can be used as general-purpose I/O pins.

Table 9: DCI I/O Standards

Category of Signal Standard	Signal Standard (IOSTANDARD)	V <sub>CC0</sub> (V)		V <sub>REF</sub> for Inputs (V)	Termination Type	
		For Outputs	For Inputs		At Output	At Input
<b>Single-Ended</b>						
Gunning Transceiver Logic	GTL_DCI	1.2	1.2	0.8	Single	Single
	GTLP_DCI	1.5	1.5	1.0		
High-Speed Transceiver Logic	HSTL_I_DCI	1.5	1.5	0.75	None	Split
	HSTL_III_DCI	1.5	1.5	0.9	None	Single
	HSTL_I_DCI_18	1.8	1.8	0.9	None	Split
	HSTL_II_DCI_18	1.8	1.8	0.9	Split	
	HSTL_III_DCI_18	1.8	1.8	1.1	None	Single
Low-Voltage CMOS	LVDCI_15	1.5	1.5	-	Controlled impedance driver	None
	LVDCI_18	1.8	1.8	-		
	LVDCI_25	2.5	2.5	-		
	LVDCI_33 <sup>(3)</sup>	3.3	3.3	-		
	LVDCI_DV2_15	1.5	1.5	-	Controlled driver with half-impedance	
	LVDCI_DV2_18	1.8	1.8	-		
	LVDCI_DV2_25	2.5	2.5	-		
	LVDCI_DV2_33	3.3	3.3	-		
Stub Series Terminated Logic	SSTL18_I_DCI	1.8	1.8	0.9	25-Ohm driver	Split
	SSTL2_I_DCI	2.5	2.5	1.25	None	
	SSTL2_II_DCI	2.5	2.5	1.25	Split with 25-Ohm driver	
<b>Differential</b>						
Low-Voltage Differential Signalling	LVDS_25_DCI	2.5	2.5	-	None	Split on each line of pair
	LVDS_25_DCI	2.5	2.5	-		

**Notes:**

1. DCI signal standards are not supported in Bank 5 of any Spartan-3 FPGA packaged in a VQ100, CP132, or TQ144 package.
2. The SSTL18\_II signal standard does not have a DCI equivalent.
3. Equivalent to LVTTTL DCI.

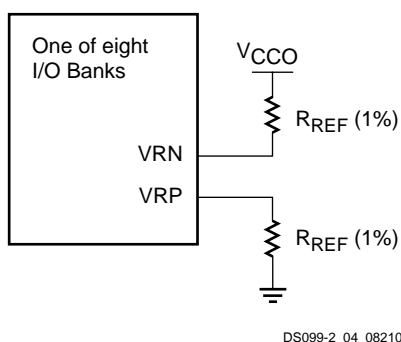

Table 10: DCI Terminations

Termination	Schematic(1)	Signal Standards (IOSTANDARD)
Controlled impedance output driver		LVDCI_15 LVDCI_18 LVDCI_25 LVDCI_33
Controlled output driver with half impedance		LVDCI_DV2_15 LVDCI_DV2_18 LVDCI_DV2_25 LVDCI_DV2_33
Single resistor		GTL_DCI GTLP_DCI HSTL_III_DCI(2) HSTL_III_DCI_18(2)
Split resistors		HSTL_I_DCI(2) HSTL_I_DCI_18(2) HSTL_II_DCI_18 LVDS_25_DCI LVDSEXT_25_DCI
Split resistors with output driver impedance fixed to 25Ω		SSTL18_I_DCI(3) SSTL2_I_DCI(3) SSTL2_II_DCI

**Notes:**

1. The value of R is equivalent to the characteristic impedance of the line connected to the I/O. It is also equal to half the value of  $R_{REF}$  for the DV2 standards and  $R_{REF}$  for all other DCI standards.
2. For DCI using HSTL Classes I and III, terminations only go into effect at inputs (not at outputs).
3. For DCI using SSTL Class I, the split termination only goes into effect at inputs (not at outputs).

The DCI feature operates independently for each of the device's eight banks. Each bank has an 'N' reference pin (VRN) and a 'P' reference pin, (VRP), to calibrate driver and termination resistance. Only when using a DCI standard on a given bank do these two pins function as VRN and VRP. When not using a DCI standard, the two pins function as user I/Os. As shown in [Figure 7](#), add an external reference resistor to pull the VRN pin up to  $V_{CCO}$  and another reference resistor to pull the VRP pin down to GND. Also see [Figure 40, page 107](#). Both resistors have the same value — commonly 50 Ohms — with one-percent tolerance, which is either the characteristic impedance of the line or twice that, depending on the DCI standard in use. Standards having a symbol name that contains the letters "DV2" use a reference resistor value that is twice the line impedance. DCI adjusts the output driver impedance to match the reference resistors' value or half that, according to the standard. DCI always adjusts the on-chip termination resistors to directly match the reference resistors' value.

DS099-2\_04\_082104

Figure 7: Connection of Reference Resistors ( $R_{REF}$ )

The rules guiding the use of DCI standards on banks are as follows:

1. No more than one DCI I/O standard with a Single Termination is allowed per bank.
2. No more than one DCI I/O standard with a Split Termination is allowed per bank.
3. Single Termination, Split Termination, Controlled-Impedance Driver, and Controlled-Impedance Driver with Half Impedance can co-exist in the same bank.

See also [The Organization of IOBs into Banks](#), immediately below, and [DCI: User I/O or Digitally Controlled Impedance Resistor Reference Input](#), page 107.

## The Organization of IOBs into Banks

IOBs are allocated among eight banks, so that each side of the device has two banks, as shown in [Figure 8](#). For all packages, each bank has independent  $V_{REF}$  lines. For example,  $V_{REF}$  Bank 3 lines are separate from the  $V_{REF}$  lines going to all other banks.

For the Very Thin Quad Flat Pack (VQ), Plastic Quad Flat Pack (PQ), Fine Pitch Thin Ball Grid Array (FT), and Fine Pitch Ball Grid Array (FG) packages, each bank has dedi-

cated  $V_{CCO}$  lines. For example, the  $V_{CCO}$  Bank 7 lines are separate from the  $V_{CCO}$  lines going to all other banks. Thus, Spartan-3 devices in these packages support eight independent  $V_{CCO}$  supplies.

DS099-2\_03\_082104

Figure 8: Spartan-3 I/O Banks (top view)

In contrast, the 144-pin Thin Quad Flat Pack (TQ144) package and the 132-pin Chip-Scale Package (CP132) tie  $V_{CCO}$  together internally for the pair of banks on each side of the device. For example, the  $V_{CCO}$  Bank 0 and the  $V_{CCO}$  Bank 1 lines are tied together. The interconnected bank-pairs are 0/1, 2/3, 4/5, and 6/7. As a result, Spartan-3 devices in the CP132 and TQ144 packages support four independent  $V_{CCO}$  supplies.

## Spartan-3 Compatibility

Within the Spartan-3 family, all devices are pin-compatible by package. When the need for future logic resources outgrows the capacity of the Spartan-3 device in current use, a larger device in the same package can serve as a direct replacement. Larger devices may add extra  $V_{REF}$  and  $V_{CCO}$  lines to support a greater number of I/Os. In the larger device, more pins can convert from user I/Os to  $V_{REF}$  lines. Also, additional  $V_{CCO}$  lines are bonded out to pins that were "not connected" in the smaller device. Thus, it is important to plan for future upgrades at the time of the board's initial design by laying out connections to the extra pins.

The Spartan-3 family is not pin-compatible with any previous Xilinx FPGA family.

## Rules Concerning Banks

When assigning I/Os to banks, it is important to follow the following  $V_{CCO}$  rules:

1. Leave no  $V_{CCO}$  pins unconnected on the FPGA.
2. Set all  $V_{CCO}$  lines associated with the (interconnected) bank to the same voltage level.
3. The  $V_{CCO}$  levels used by all standards assigned to the I/Os of the (interconnected) bank(s) must agree. The Xilinx development software checks for this. [Tables 7, 8](#),

and 9 describe how different standards use the  $V_{CCO}$  supply.

4. Only one of the following standards is allowed per bank: LVDS, LDT, LVDS\_EXT, or RSDS.
5. If none of the standards assigned to the I/Os of the (interconnected) bank(s) uses  $V_{CCO}$ , tie all associated  $V_{CCO}$  lines to 2.5V.
6. In general, apply 2.5V to  $V_{CCO}$  Bank 4 from power-on to the end of configuration. Apply the same voltage to  $V_{CCO}$  Bank 5 during parallel configuration or a Readback operation. For information on how to program the FPGA using 3.3V signals and power, see the **3.3V-Tolerant Configuration Interface** section.

If any of the standards assigned to the Inputs of the bank use  $V_{REF}$  then observe the following additional rules:

1. Connect *all*  $V_{REF}$  pins within the bank to the same voltage level.
2. The  $V_{REF}$  levels used by all standards assigned to the Inputs of the bank must agree. The Xilinx development software checks for this. Tables 7 and 9 describe how different standards use the  $V_{REF}$  supply.

If none of the standards assigned to the Inputs of a bank use  $V_{REF}$  for biasing input switching thresholds, all associated  $V_{REF}$  pins function as User I/Os.

### Exceptions to Banks Supporting I/O Standards

Bank 5 of any Spartan-3 device in a VQ100, CP132, or TQ144 package does not support DCI signal standards. In this case, bank 5 has neither VRN nor VRP pins.

Furthermore, banks 4 and 5 of any Spartan-3 device in a VQ100 package do not support signal standards using  $V_{REF}$  (see Table 7). In this case, the two banks do not have any  $V_{REF}$  pins.

### Supply Voltages for the IOBs

Three different supplies power the IOBs:

1. The  $V_{CCO}$  supplies, one for each of the FPGA's I/O banks, power the output drivers, except when using the GTL and GTLP signal standards. The voltage on the  $V_{CCO}$  pins determines the voltage swing of the output signal.
2.  $V_{CCINT}$  is the main power supply for the FPGA's internal logic.

3. The  $V_{CCAUX}$  is an auxiliary source of power, primarily to optimize the performance of various FPGA functions such as I/O switching.

### The I/Os During Power-On, Configuration, and User Mode

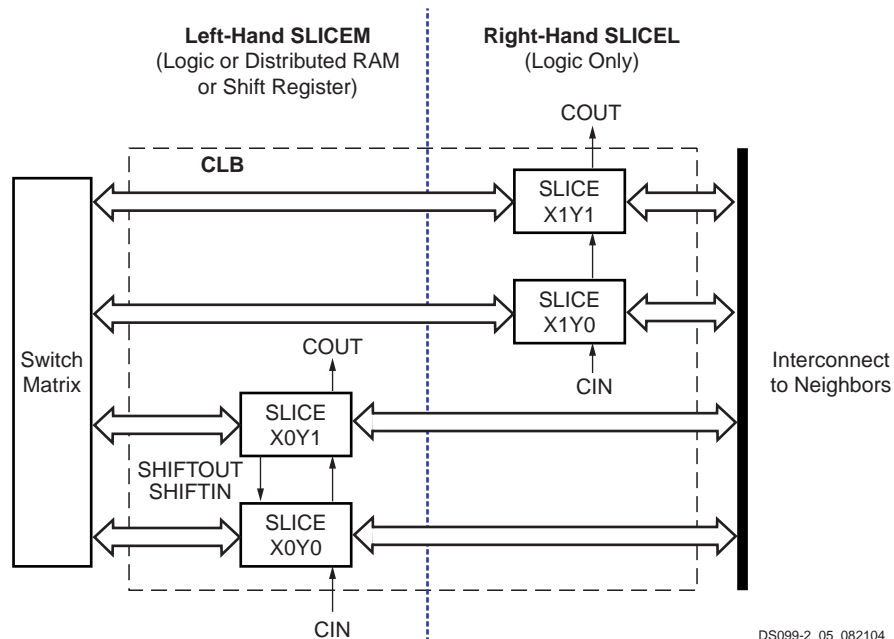

With no power applied to the FPGA, all I/Os are in a high-impedance state. The  $V_{CCINT}$  (1.2V),  $V_{CCAUX}$  (2.5V), and  $V_{CCO}$  supplies may be applied in any order. Before power-on can finish,  $V_{CCINT}$ ,  $V_{CCO}$  Bank 4, and  $V_{CCAUX}$  must have reached their respective minimum recommended operating levels (see Table 28, page 54). At this time, all I/O drivers also will be in a high-impedance state.  $V_{CCO}$  Bank 4,  $V_{CCINT}$ , and  $V_{CCAUX}$  serve as inputs to the internal Power-On Reset circuit (POR).

A Low level applied to the HSWAP\_EN input enables pull-up resistors on User I/Os from power-on throughout configuration. A High level on HSWAP\_EN disables the pull-up resistors, allowing the I/Os to float. If the HSWAP\_EN pin is floating, then an internal pull-up resistor pulls HSWAP\_EN High. As soon as power is applied, the FPGA begins initializing its configuration memory. At the same time, the FPGA internally asserts the Global Set-Reset (GSR), which asynchronously resets all IOB storage elements to a Low state.

Upon the completion of initialization, INIT\_B goes High, sampling the M0, M1, and M2 inputs to determine the configuration mode. At this point, the configuration data is loaded into the FPGA. The I/O drivers remain in a high-impedance state (with or without pull-up resistors, as determined by the HSWAP\_EN input) throughout configuration.

The Global Three State (GTS) net is released during Start-Up, marking the end of configuration and the beginning of design operation in the User mode. At this point, those I/Os to which signals have been assigned go active while all unused I/Os remain in a high-impedance state. The release of the GSR net, also part of Start-up, leaves the IOB registers in a Low state by default, unless the loaded design reverses the polarity of their respective RS inputs.

In User mode, all internal pull-up resistors on the I/Os are disabled and HSWAP\_EN becomes a “don't care” input. If it is desirable to have pull-up or pull-down resistors on I/Os carrying signals, the appropriate symbol — e.g., PULLUP, PULLDOWN — must be placed at the appropriate pads in the design. The Bitstream Generator (Bitgen) option UnusedPin available in the Xilinx development software determines whether unused I/Os collectively have pull-up resistors, pull-down resistors, or no resistors in User mode.

DS099-2\_05\_082104

Figure 9: Arrangement of Slices within the CLB

## CLB Overview

The Configurable Logic Blocks (CLBs) constitute the main logic resource for implementing synchronous as well as combinatorial circuits. Each CLB comprises four interconnected slices, as shown in Figure 9. These slices are grouped in pairs. Each pair is organized as a column with an independent carry chain.

The nomenclature that the FPGA Editor — part of the Xilinx development software — uses to designate slices is as follows: The letter 'X' followed by a number identifies columns of slices. The 'X' number counts up in sequence from the left side of the die to the right. The letter 'Y' followed by a number identifies the position of each slice in a pair as well as indicating the CLB row. The 'Y' number counts slices starting from the bottom of the die according to the sequence: 0, 1, 0, 1 (the first CLB row); 2, 3, 2, 3 (the second CLB row); etc. Figure 9 shows the CLB located in the lower left-hand corner of the die. Slices X0Y0 and X0Y1 make up the column-pair on the left where as slices X1Y0 and X1Y1 make up the column-pair on the right. For each CLB, the term "left-hand" (or SLICEM) indicates the pair of slices labeled with an even 'X' number, such as X0, and the term "right-hand" (or SLICEL) designates the pair of slices with an odd 'X' number, e.g., X1.

## Elements Within a Slice

All four slices have the following elements in common: two logic function generators, two storage elements, wide-function multiplexers, carry logic, and arithmetic gates, as shown in Figure 10. Both the left-hand and right-hand slice

pairs use these elements to provide logic, arithmetic, and ROM functions. Besides these, the left-hand pair supports two additional functions: storing data using Distributed RAM and shifting data with 16-bit registers. Figure 10 is a diagram of the left-hand slice; therefore, it represents a super-set of the elements and connections to be found in all slices. See [Function Generator](#), page 22 for more information.

The RAM-based function generator — also known as a Look-Up Table or LUT — is the main resource for implementing logic functions. Furthermore, the LUTs in each left-hand slice pair can be configured as Distributed RAM or a 16-bit shift register. For information on the former, see [XAPP464: Using Look-Up Tables as Distributed RAM in Spartan-3 FPGAs](#); for information on the latter, refer to [XAPP465: Using Look-Up Tables as Shift Registers \(SRL16\) in Spartan-3 FPGAs](#). The function generators located in the upper and lower portions of the slice are referred to as the "G" and "F", respectively.

The storage element, which is programmable as either a D-type flip-flop or a level-sensitive latch, provides a means for synchronizing data to a clock signal, among other uses. The storage elements in the upper and lower portions of the slice are called FFY and FFX, respectively.

Wide-function multiplexers effectively combine LUTs in order to permit more complex logic operations. Each slice has two of these multiplexers with F5MUX in the lower portion of the slice and FiMUX in the upper portion. Depending on the slice, FiMUX takes on the name F6MUX, F7MUX, or F8MUX. For more details on the multiplexers, see [XAPP466: Using Dedicated Multiplexers in Spartan-3 FPGAs](#).

DS099-2\_06\_041103

**Notes:**

- Options to invert signal polarity as well as other options that enable lines for various functions are not shown.
- The index *i* can be 6, 7, or 8, depending on the slice. In this position, the upper right-hand slice has an F8MUX, and the upper left-hand slice has an F7MUX. The lower right-hand and left-hand slices both have an F6MUX.

Figure 10: Simplified Diagram of the Left-Hand SLICEM

The carry chain, together with various dedicated arithmetic logic gates, support fast and efficient implementations of math operations. The carry chain enters the slice as CIN and exits as COUT. Five multiplexers control the chain: CYINIT, CY0F, and CYMUXF in the lower portion as well as CY0G and CYMUXG in the upper portion. The dedicated arithmetic logic includes the exclusive-OR gates XORG and XORF (upper and lower portions of the slice, respectively) as well as the AND gates GAND and FAND (upper and lower portions, respectively).

## Main Logic Paths

Central to the operation of each slice are two nearly identical data paths, distinguished using the terms *top* and *bottom*. The description that follows uses names associated with the bottom path. (The top path names appear in parentheses.) The basic path originates at an interconnect-switch matrix outside the CLB. Four lines, F1 through F4 (or G1 through G4 on the upper path), enter the slice and connect directly to the LUT. Once inside the slice, the lower 4-bit path passes through a function generator 'F' (or 'G') that performs logic operations. The function generator's Data output, 'D', offers five possible paths:

1. Exit the slice via line 'X' (or 'Y') and return to interconnect.
2. Inside the slice, 'X' (or 'Y') serves as an input to the DXMUX (DYMUX) which feeds the data input, 'D', of the FFX (FFY) storage element. The 'Q' output of the storage element drives the line XQ (or YQ) which exits the slice.
3. Control the CYMUXF (or CYMUXG) multiplexer on the carry chain.
4. With the carry chain, serve as an input to the XORF (or XORG) exclusive-OR gate that performs arithmetic operations, producing a result on 'X' (or 'Y').
5. Drive the multiplexer F5MUX to implement logic functions wider than four bits. The 'D' outputs of both the F-LUT and G-LUT serve as data inputs to this multiplexer.

In addition to the main logic paths described above, there are two bypass paths that enter the slice as BX and BY. Once inside the FPGA, BX in the bottom half of the slice (or BY in the top half) can take any of several possible branches:

1. Bypass both the LUT and the storage element, then exit the slice as BXOUT (or BYOUT) and return to interconnect.
2. Bypass the LUT, then pass through a storage element via the D input before exiting as XQ (or YQ).
3. Control the wide function multiplexer F5MUX (or F6MUX).
4. Via multiplexers, serve as an input to the carry chain.

5. Drives the DI input of the LUT.
6. BY can control the REV inputs of both the FFY and FFX storage elements.
7. Finally, the DIG\_MUX multiplexer can switch BY onto the DIG line, which exits the slice.

Other slice signals shown in [Figure 10, page 21](#) are discussed in the sections that follow.

## Function Generator

Each of the two LUTs (F and G) in a slice have four logic inputs (A1-A4) and a single output (D). This permits any four-variable Boolean logic operation to be programmed into them. Furthermore, wide function multiplexers can be used to effectively combine LUTs within the same CLB or across different CLBs, making logic functions with still more input variables possible.

The LUTs in both the right-hand and left-hand slice-pairs not only support the logic functions described above, but also can function as ROM that is initialized with data at the time of configuration.

The LUTs in the left-hand slice-pair (even-numbered columns such as X0 in [Figure 9](#)) of each CLB support two additional functions that the right-hand slice-pair (odd-numbered columns such as X1) do not.

First, it is possible to program the "left-hand LUTs" as distributed RAM. This type of memory affords moderate amounts of data buffering anywhere along a data path. One left-hand LUT stores 16 bits. Multiple left-hand LUTs can be combined in various ways to store larger amounts of data. A dual port option combines two LUTs so that memory access is possible from two independent data lines. A Distributed ROM option permits pre-loading the memory with data during FPGA configuration.

Second, it is possible to program each left-hand LUT as a 16-bit shift register. Used in this way, each LUT can delay serial data anywhere from one to 16 clock cycles. The four left-hand LUTs of a single CLB can be combined to produce delays up to 64 clock cycles. The SHIFTIN and SHIFTOUT lines cascade LUTs to form larger shift registers. It is also possible to combine shift registers across more than one CLB. The resulting programmable delays can be used to balance the timing of data pipelines.

## Block RAM Overview

All Spartan-3 devices support block RAM, which is organized as configurable, synchronous 18Kbit blocks. Block RAM stores relatively large amounts of data more efficiently than the distributed RAM feature described earlier. (The latter is better suited for buffering small amounts of data anywhere along signal paths.) This section describes basic Block RAM functions. For more information, see [XAPP463: Using Block RAM in Spartan-3 FPGAs](#).

The aspect ratio — i.e., width vs. depth — of each block RAM is configurable. Furthermore, multiple blocks can be cascaded to create still wider and/or deeper memories.

A choice among primitives determines whether the block RAM functions as dual- or single-port memory. A name of the form RAMB16\_S[w<sub>A</sub>]<sub>S</sub>[w<sub>B</sub>] calls out the dual-port primitive, where the integers w<sub>A</sub> and w<sub>B</sub> specify the total data path width at ports w<sub>A</sub> and w<sub>B</sub>, respectively. Thus, a RAMB16\_S9\_S18 is a dual-port RAM with a 9-bit-wide Port A and an 18-bit-wide Port B. A name of the form RAMB16\_S[w] identifies the single-port primitive, where the integer w specifies the total data path width of the lone port. A RAMB16\_S18 is a single-port RAM with an 18-bit-wide port. Other memory functions — e.g., FIFOs, data path width conversion, ROM, etc. — are readily available using the CORE Generator™ system, part of the Xilinx development software.

### Arrangement of RAM Blocks on Die

The XC3S50 has one column of block RAM. The Spartan-3 devices ranging from the XC3S200 to XC3S2000 have two columns of block RAM. The XC3S4000 and XC3S5000 have four columns. The position of the columns on the die is shown in Figure 1, page 4. For a given device, the total available RAM blocks are distributed equally among the columns. Table 11 shows the number of RAM blocks, the data storage capacity, and the number of columns for each device.

Table 11: Number of RAM Blocks by Device

Device	Total Number of RAM Blocks	Total Addressable Locations (bits)	Number of Columns
XC3S50	4	73,728	1
XC3S200	12	221,184	2
XC3S400	16	294,912	2
XC3S1000	24	442,368	2
XC3S1500	32	589,824	2
XC3S2000	40	737,280	2
XC3S4000	96	1,769,472	4
XC3S5000	104	1,916,928	4

Block RAM and multipliers have interconnects between them that permit simultaneous operation; however, since the multiplier shares inputs with the upper data bits of block RAM, the maximum data path width of the block RAM is 18 bits in this case.

### The Internal Structure of the Block RAM

The block RAM has a dual port structure. The two identical data ports called A and B permit independent access to the common RAM block, which has a maximum capacity of 18,432 bits — or 16,384 bits when no parity lines are used. Each port has its own dedicated set of data, control and clock lines for synchronous read and write operations. There are four basic data paths, as shown in Figure 11: (1) write to and read from Port A, (2) write to and read from Port B, (3) data transfer from Port A to Port B, and (4) data transfer from Port B to Port A.

DS099-2\_12\_030703

Figure 11: Block RAM Data Paths

### Block RAM Port Signal Definitions

Representations of the dual-port primitive RAMB16\_S[w<sub>A</sub>]<sub>S</sub>[w<sub>B</sub>] and the single-port primitive RAMB16\_S[w] with their associated signals are shown in Figure 12a and Figure 12b, respectively. These signals are defined in Table 12.

DS099-2\_13\_112905

**Notes:**

1.  $w_A$  and  $w_B$  are integers representing the total data path width (i.e., data bits plus parity bits) at ports A and B, respectively.
2.  $p_A$  and  $p_B$  are integers that indicate the number of data path lines serving as parity bits.
3.  $r_A$  and  $r_B$  are integers representing the address bus width at ports A and B, respectively.
4. The control signals CLK, WE, EN, and SSR on both ports have the option of inverted polarity.

Figure 12: Block RAM Primitives

Table 12: Block RAM Port Signals

Signal Description	Port A Signal Name	Port B Signal Name	Direction	Function
Address Bus	ADDRA	ADDRB	Input	The Address Bus selects a memory location for read or write operations. The width ( $w$ ) of the port's associated data path determines the number of available address lines ( $r$ ). Whenever a port is enabled ( $ENA$ or $ENB = \text{High}$ ), address transitions must meet the data sheet setup and hold times with respect to the port clock ( $CLKA$ or $CLKB$ ). This requirement must be met, even if the RAM read output is of no interest.
Data Input Bus	DIA	DIB	Input	Data at the DI input bus is written to the addressed memory location addressed on an enabled active CLK edge. It is possible to configure a port's total data path width ( $w$ ) to be 1, 2, 4, 9, 18, or 36 bits. This selection applies to both the DI and DO paths of a given port. Each port is independent. For a port assigned a width ( $w$ ), the number of addressable locations is $16,384/(w-p)$ where " $p$ " is the number of parity bits. Each memory location has a width of " $w$ " (including parity bits). See the DIP signal description for more information of parity.
Parity Data Input(s)	DIPA	DIPB	Input	Parity inputs represent additional bits included in the data input path to support error detection. The number of parity bits " $p$ " included in the DI (same as for the DO bus) depends on a port's total data path width ( $w$ ). See Table 13.

Table 12: Block RAM Port Signals (Continued)

Signal Description	Port A Signal Name	Port B Signal Name	Direction	Function
Data Output Bus	DOA	DOB	Output	<p>Basic data access occurs whenever WE is inactive. The DO outputs mirror the data stored in the addressed memory location.</p> <p>Data access with WE asserted is also possible if one of the following two attributes is chosen: WRITE_FIRST and READ_FIRST. WRITE_FIRST simultaneously presents the new input data on the DO output port and writes the data to the address RAM location. READ_FIRST presents the previously stored RAM data on the DO output port while writing new data to RAM.</p> <p>A third attribute, NO_CHANGE, latches the DO outputs upon the assertion of WE.</p> <p>It is possible to configure a port's total data path width (w) to be 1, 2, 4, 9, 18, or 36 bits. This selection applies to both the DI and DO paths. See the DI signal description.</p>
Parity Data Output(s)	DOPA	DOPB	Output	<p>Parity inputs represent additional bits included in the data input path to support error detection. The number of parity bits "p" included in the DI (same as for the DO bus) depends on a port's total data path width (w). See <a href="#">Table 13</a>.</p>
Write Enable	WEA	WEB	Input	<p>When asserted together with EN, this input enables the writing of data to the RAM. In this case, the data access attributes WRITE_FIRST, READ_FIRST or NO_CHANGE determines if and how data is updated on the DO outputs. See the DO signal description.</p> <p>When WE is inactive with EN asserted, read operations are still possible. In this case, a transparent latch passes data from the addressed memory location to the DO outputs.</p>
Clock Enable	ENA	ENB	Input	<p>When asserted, this input enables the CLK signal to synchronize Block RAM functions as follows: the writing of data to the DI inputs (when WE is also asserted), the updating of data at the DO outputs as well as the setting/resetting of the DO output latches.</p> <p>When de-asserted, the above functions are disabled.</p>
Set/Reset	SSRA	SSRB	Input	<p>When asserted, this pin forces the DO output latch to the value that the SRVAL attribute is set to. A Set/Reset operation on one port has no effect on the other ports functioning, nor does it disturb the memory's data contents. It is synchronized to the CLK signal.</p>
Clock	CLKA	CLKB	Input	<p>This input accepts the clock signal to which read and write operations are synchronized. All associated port inputs are required to meet setup times with respect to the clock signal's active edge. The data output bus responds after a clock-to-out delay referenced to the clock signal's active edge.</p>

### Port Aspect Ratios

On a given port, it is possible to select a number of different possible widths (w – p) for the DI/DO buses as shown in

[Table 13](#). These two buses always have the same width. This data bus width selection is independent for each port. If the data bus width of Port A differs from that of Port B, the

Block RAM automatically performs a bus-matching function. When data are written to a port with a narrow bus, then read from a port with a wide bus, the latter port will effectively combine “narrow” words to form “wide” words. Similarly, when data are written into a port with a wide bus, then read from a port with a narrow bus, the latter port will divide “wide” words to form “narrow” words. When the data bus width is eight bits or greater, extra parity bits become available. The width of the total data path ( $w$ ) is the sum of the DI/DO bus width and any parity bits ( $p$ ).

The width selection made for the DI/DO bus determines the number of address lines according to the relationship expressed below:

$$r = 14 - \lceil \log(w-p)/\log(2) \rceil \quad (1)$$

In turn, the number of address lines delimits the total number ( $n$ ) of addressable locations or depth according to the following equation:

$$n = 2^r \quad (2)$$

The product of  $w$  and  $n$  yields the total block RAM capacity. Equations (1) and (2) show that as the data bus width increases, the number of address lines along with the number of addressable memory locations decreases. Using the permissible DI/DO bus widths as inputs to these equations provides the bus width and memory capacity measures shown in [Table 13](#).

Table 13: Port Aspect Ratios for Port A or B

DI/DO Bus Width ( $w - p$ bits)	DIP/DOP Bus Width ( $p$ bits)	Total Data Path Width ( $w$ bits)	ADDR Bus Width ( $r$ bits)	No. of Addressable Locations ( $n$ )	Block RAM Capacity (bits)
1	0	1	14	16,384	16,384
2	0	2	13	8,192	16,384
4	0	4	12	4,096	16,384
8	1	9	11	2,048	18,432
16	2	18	10	1,024	18,432
32	4	36	9	512	18,432

## Block RAM Data Operations

Writing data to and accessing data from the block RAM are synchronous operations that take place independently on each of the two ports.

The waveforms for the write operation are shown in the top half of the [Figure 13](#), [Figure 14](#), and [Figure 15](#). When the WE and EN signals enable the active edge of CLK, data at the DI input bus is written to the block RAM location addressed by the ADDR lines.

There are a number of different conditions under which data can be accessed at the DO outputs. Basic data access always occurs when the WE input is inactive. Under this condition, data stored in the memory location addressed by

the ADDR lines passes through a transparent output latch to the DO outputs. The timing for basic data access is shown in the portions of [Figure 13](#), [Figure 14](#), and [Figure 15](#) during which WE is Low.

Data can also be accessed on the DO outputs when asserting the WE input. This is accomplished using two different attributes:

Choosing the WRITE\_FIRST attribute, data is written to the addressed memory location on an enabled active CLK edge and is also passed to the DO outputs. WRITE\_FIRST timing is shown in the portion of [Figure 13](#) during which WE is High.

Figure 13: Waveforms of Block RAM Data Operations with WRITE\_FIRST Selected

Choosing the READ\_FIRST attribute, data already stored in the addressed location pass to the DO outputs before that location is overwritten with new data from the DI inputs on

an enabled active CLK edge. READ\_FIRST timing is shown in the portion of Figure 14 during which WE is High.

Figure 14: Waveforms of Block RAM Data Operations with READ\_FIRST Selected

Choosing a third attribute called NO\_CHANGE puts the DO outputs in a latched state when asserting WE. Under this condition, the DO outputs will retain the data driven just

before WE was asserted. NO\_CHANGE timing is shown in the portion of Figure 15 during which WE is High.

Figure 15: Waveforms of Block RAM Data Operations with NO\_CHANGE Selected

## Dedicated Multipliers

All Spartan-3 devices provide embedded multipliers that accept two 18-bit words as inputs to produce a 36-bit product. This section provides an introduction to multipliers. For further details, see [XAPP467: Using Embedded Multipliers in Spartan-3 FPGAs](#).

The input buses to the multiplier accept data in two's-complement form (either 18-bit signed or 17-bit unsigned). One such multiplier is matched to each block RAM on the die. The close physical proximity of the two ensures efficient

data handling. Cascading multipliers permits multiplicands more than three in number as well as wider than 18-bits. The multiplier is placed in a design using one of two primitives: an asynchronous version called MULT18X18 and a version with a register called MULT18X18S, as shown in [Figure 16a](#) and [Figure 16b](#), respectively. The signals for these primitives are defined in [Table 14](#).

The CORE Generator system produces multipliers based on these primitives that can be configured to suit a wide range of requirements.

DS099-2\_17\_052705

Figure 16: Embedded Multiplier Primitives

Table 14: Embedded Multiplier Primitives Descriptions

Signal Name	Direction	Function
A[17:0]	Input	Apply one 18-bit multiplicand to these inputs. The MULT18X18S primitive requires a setup time before the enabled rising edge of CLK.
B[17:0]	Input	Apply the other 18-bit multiplicand to these inputs. The MULT18X18S primitive requires a setup time before the enabled rising edge of CLK.
P[35:0]	Output	The output on the P bus is a 36-bit product of the multiplicands A and B. In the case of the MULT18X18S primitive, an enabled rising CLK edge updates the P bus.
CLK	Input	CLK is only an input to the MULT18X18S primitive. The clock signal applied to this input when enabled by CE, updates the output register that drives the P bus.
CE	Input	CE is only an input to the MULT18X18S primitive. Enable for the CLK signal. Asserting this input enables the CLK signal to update the P bus.
RST	Input	RST is only an input to the MULT18X18S primitive. Asserting this input resets the output register on an enabled, rising CLK edge, forcing the P bus to all zeroes.

**Notes:**

1. The control signals CLK, CE and RST have the option of inverted polarity.

## Digital Clock Manager (DCM)

Spartan-3 devices provide flexible, complete control over clock frequency, phase shift and skew through the use of the DCM feature. To accomplish this, the DCM employs a Delay-Locked Loop (DLL), a fully digital control system that uses feedback to maintain clock signal characteristics with a high degree of precision despite normal variations in operating temperature and voltage. This section provides a fundamental description of the DCM. For further information, see [XAPP462: Using Digital Clock Managers \(DCMs\) in Spartan-3 FPGAs](#).

Each member of the Spartan-3 family has four DCMs, except the smallest, the XC3S50, which has two DCMs. The DCMs are located at the ends of the outermost Block RAM column(s). See [Figure 1, page 4](#). The Digital Clock Manager is placed in a design as the “DCM” primitive.

The DCM supports three major functions:

- **Clock-skew Elimination:** Clock skew describes the extent to which clock signals may, under normal circumstances, deviate from zero-phase alignment. It occurs when slight differences in path delays cause the clock signal to arrive at different points on the die at different times. This clock skew can increase set-up and hold time requirements as well as clock-to-out time, which may be undesirable in applications operating at a high frequency, when timing is critical. The DCM eliminates clock skew by aligning the output clock signal it generates with another version of the clock signal that is fed back. As a result, the two clock signals establish a zero-phase relationship. This effectively cancels out clock distribution delays that may lie in the signal path leading from the clock output of the DCM to its feedback input.
- **Frequency Synthesis:** Provided with an input clock signal, the DCM can generate a wide range of different output clock frequencies. This is accomplished by either multiplying and/or dividing the frequency of the input clock signal by any of several different factors.
- **Phase Shifting:** The DCM provides the ability to shift the phase of all its output clock signals with respect to its input clock signal.

DS099-2\_07\_040103

Figure 17: DCM Functional Blocks and Associated Signals

The DCM has four functional components: the Delay-Locked Loop (DLL), the Digital Frequency Synthesizer (DFS), the Phase Shifter (PS), and the Status Logic. Each component has its associated signals, as shown in Figure 17.

### Delay-Locked Loop (DLL)

The most basic function of the DLL component is to eliminate clock skew. The main signal path of the DLL consists of an input stage, followed by a series of discrete delay elements or *taps*, which in turn leads to an output stage. This

path together with logic for phase detection and control forms a system complete with feedback as shown in Figure 18.

DS099-2\_08\_041103

Figure 18: Simplified Functional Diagram of DLL

The DLL component has two clock inputs, CLKIN and CLKFB, as well as seven clock outputs, CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV as described in [Table 15](#). The clock outputs drive simultaneously; however, the High Frequency mode only supports

a subset of the outputs available in the Low Frequency mode. See [DLL Frequency Modes, page 33](#). Signals that initialize and report the state of the DLL are discussed in [The Status Logic Component, page 38](#).

**Table 15: DLL Signals**

Signal	Direction	Description	Mode Support	
			Low Frequency	High Frequency
CLKIN	Input	Accepts original clock signal.	Yes	Yes
CLKFB	Input	Accepts either CLK0 or CLK2X as feed back signal. (Set CLK_FEEDBACK attribute accordingly).	Yes	Yes
CLK0	Output	Generates clock signal with same frequency and phase as CLKIN.	Yes	Yes
CLK90	Output	Generates clock signal with same frequency as CLKIN, only phase-shifted 90°.	Yes	No
CLK180	Output	Generates clock signal with same frequency as CLKIN, only phase-shifted 180°.	Yes	Yes
CLK270	Output	Generates clock signal with same frequency as CLKIN, only phase-shifted 270°.	Yes	No
CLK2X	Output	Generates clock signal with same phase as CLKIN, only twice the frequency.	Yes	No
CLK2X180	Output	Generates clock signal with twice the frequency of CLKIN, phase-shifted 180° with respect to CLKIN.	Yes	No
CLKDV	Output	Divides the CLKIN frequency by CLKDV_DIVIDE value to generate lower frequency clock signal that is phase-aligned to CLKIN.	Yes	Yes

The clock signal supplied to the CLKIN input serves as a reference waveform, with which the DLL seeks to align the feedback signal at the CLKFB input. When eliminating clock skew, the common approach to using the DLL is as follows: The CLK0 signal is passed through the clock distribution network to all the registers it synchronizes. These registers are either internal or external to the FPGA. After passing through the clock distribution network, the clock signal returns to the DLL via a feedback line called CLKFB. The control block inside the DLL measures the phase error between CLKFB and CLKIN. This phase error is a measure of the clock skew that the clock distribution network intro-

duces. The control block activates the appropriate number of delay elements to cancel out the clock skew. Once the DLL has brought the CLK0 signal in phase with the CLKIN signal, it asserts the LOCKED output, indicating a “lock” on to the CLKIN signal.

***DLL Attributes and Related Functions***

A number of different functional options can be set for the DLL component through the use of the attributes described in [Table 16](#). Each attribute is described in detail in the sections that follow:

Table 16: DLL Attributes

Attribute	Description	Values
CLK_FEEDBACK	Chooses either the CLK0 or CLK2X output to drive the CLKFB input	NONE, 1X, 2X
DLL_FREQUENCY_MODE	Chooses between High Frequency and Low Frequency modes	LOW, HIGH
CLKIN_DIVIDE_BY_2	Halves the frequency of the CLKIN signal just as it enters the DCM	TRUE, FALSE
CLKDV_DIVIDE	Selects constant used to divide the CLKIN input frequency to generate the CLKDV output frequency	1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6.0, 6.5, 7.0, 7.5, 8, 9, 10, 11, 12, 13, 14, 15, and 16.
DUTY_CYCLE_CORRECTION	Enables 50% duty cycle correction for the CLK0, CLK90, CLK180, and CLK270 outputs	TRUE, FALSE

### DLL Clock Input Connections

An external clock source enters the FPGA using a Global Clock Input Buffer (IBUFG), which directly accesses the global clock network or an Input Buffer (IBUF). Clock signals within the FPGA drive a global clock net using a Global Clock Multiplexer Buffer (BUFGMUX). The global clock net connects directly to the CLKIN input. The internal and external connections are shown in [Figure 19a](#) and [Figure 19c](#), respectively. A differential clock (e.g., LVDS) can serve as an input to CLKIN.

### DLL Clock Output and Feedback Connections

As many as four of the nine DCM clock outputs can simultaneously drive the four BUFGMUX buffers on the same die edge (top or bottom). All DCM clock outputs can simultaneously drive general routing resources, including interconnect leading to OBUF buffers.

The feedback loop is essential for DLL operation and is established by driving the CLKFB input with either the CLK0

or the CLK2X signal so that any undesirable clock distribution delay is included in the loop. It is possible to use either of these two signals for synchronizing any of the seven DLL outputs: CLK0, CLK90, CLK180, CLK270, CLKDV, CLK2X, or CLK2X180. The value assigned to the CLK\_FEEDBACK attribute must agree with the physical feedback connection: a value of 1X for the CLK0 case, 2X for the CLK2X case. If the DCM is used in an application that does not require the DLL — i.e., only the DFS is used — then there is no feedback loop so CLK\_FEEDBACK is set to NONE.

CLK2X feedback is only supported on all mask revision 'E' and later devices (see [Package Marking, page 7](#)), on devices with the "GQ" fabrication code, and on all versions of the XC3S50 and XC3S1000.

There are two basic cases that determine how to connect the DLL clock outputs and feedback connections: on-chip synchronization and off-chip synchronization, which are illustrated in [Figure 19a](#) through [Figure 19d](#).

DS099-2\_09\_082104

**Notes:**

1. In the Low Frequency mode, all seven DLL outputs are available. In the High Frequency mode, only the CLK0, CLK180, and CLKDV outputs are available.

*Figure 19: Input Clock, Output Clock, and Feedback Connections for the DLL*

In the on-chip synchronization case (Figure 19a and Figure 19b), it is possible to connect any of the DLL's seven output clock signals through general routing resources to the FPGA's internal registers. Either a Global Clock Buffer (BUFG) or a BUFGMUX affords access to the global clock network. As shown in Figure 19a, the feedback loop is created by routing CLK0 (or CLK2X, in Figure 19b) to a global clock net, which in turn drives the CLKFB input.

In the off-chip synchronization case (Figure 19c and Figure 19d), CLK0 (or CLK2X) plus any of the DLL's other output clock signals exit the FPGA using output buffers (OBUF) to drive an external clock network plus registers on the board. As shown in Figure 19c, the feedback loop is formed by feeding CLK0 (or CLK2X, in Figure 19d) back into the FPGA using an IBUFG, which directly accesses the global clock network, or an IBUF. Then, the global clock net is connected directly to the CLKFB input.

**DLL Frequency Modes**

The DLL supports two distinct operating modes, High Frequency and Low Frequency, with each specified over a different clock frequency range. The DLL\_FREQUENCY\_MODE

attribute chooses between the two modes. When the attribute is set to LOW, the Low Frequency mode permits all seven DLL clock outputs to operate over a low-to-moderate frequency range. When the attribute is set to HIGH, the High Frequency mode allows the CLK0, CLK180 and CLKDV outputs to operate at the highest possible frequencies. The remaining DLL clock outputs are not available for use in High Frequency mode.

**Accommodating High Input Frequencies**

If the frequency of the CLKIN signal is high such that it exceeds the maximum permitted, divide it down to an acceptable value using the CLKIN\_DIVIDE\_BY\_2 attribute. When this attribute is set to TRUE, the CLKIN frequency is divided by a factor of two just as it enters the DCM.

**Coarse Phase Shift Outputs of the DLL Component**

In addition to CLK0 for zero-phase alignment to the CLKIN signal, the DLL also provides the CLK90, CLK180 and CLK270 outputs for 90°, 180° and 270° phase-shifted signals, respectively. These signals are described in Table 15.

Their relative timing in the Low Frequency Mode is shown in [Figure 20](#). The CLK90, CLK180 and CLK270 outputs are not available when operating in the High Frequency mode. (See the description of the DLL\_FREQUENCY\_MODE attribute in [Table 16](#).) For control in finer increments than 90°, see the [Phase Shifter \(PS\)](#), [page 36](#) section.

### Basic Frequency Synthesis Outputs of the DLL Component

The DLL component provides basic options for frequency multiplication and division in addition to the more flexible synthesis capability of the DFS component, described in a later section. These operations result in output clock signals with frequencies that are either a fraction (for division) or a multiple (for multiplication) of the incoming clock frequency. The CLK2X output produces an in-phase signal that is twice the frequency of CLKIN. The CLK2X180 output also doubles the frequency, but is 180° out-of-phase with respect to CLKIN. The CLKDIV output generates a clock frequency that is a predetermined fraction of the CLKIN frequency. The CLKDV\_DIVIDE attribute determines the factor used to divide the CLKIN frequency. The attribute can be set to various values as described in [Table 16](#). The basic frequency synthesis outputs are described in [Table 15](#). Their relative timing in the Low Frequency Mode is shown in [Figure 20](#).

The CLK2X and CLK2X180 outputs are not available when operating in the High Frequency mode. (See the description of the DLL\_FREQUENCY\_MODE attribute in [Table 17](#).)

### Duty Cycle Correction of DLL Clock Outputs

The CLK2X<sup>(1)</sup>, CLK2X180, and CLKDV<sup>(2)</sup> output signals ordinarily exhibit a 50% duty cycle – even if the incoming CLKIN signal has a different duty cycle. Fifty-percent duty cycle means that the High and Low times of each clock cycle are equal. The DUTY\_CYCLE\_CORRECTION attribute determines whether or not duty cycle correction is applied to the CLK0, CLK90, CLK180 and CLK270 outputs. If DUTY\_CYCLE\_CORRECTION is set to TRUE, then the duty cycle of these four outputs is corrected to 50%. If DUTY\_CYCLE\_CORRECTION is set to FALSE, then these outputs exhibit the same duty cycle as the CLKIN signal. [Figure 20](#) compares the characteristics of the DLL's output signals to those of the CLKIN signal.

Phase:            0°   90° 180° 270° 0°   90° 180° 270° 0°

Input Signal (30% Duty Cycle)

Output Signal - Duty Cycle is Always Corrected

Output Signal - Attribute Corrects Duty Cycle

DUTY\_CYCLE\_CORRECTION = FALSE

DUTY\_CYCLE\_CORRECTION = TRUE

DS099-2\_10\_040206

#### Notes:

1. The DLL attribute CLKDV\_DIVIDE is set to 2.

*Figure 20: Characteristics of the DLL Clock Outputs*

1. The CLK2X output generates a 25% duty cycle clock at the same frequency as the CLKIN signal until the DLL has achieved lock.
2. The duty cycle of the CLKDV outputs may differ somewhat from 50% (i.e., the signal will be High for less than 50% of the period) when the CLKDV\_DIVIDE attribute is set to a non-integer value *and* the DLL is operating in the High Frequency mode.

## Digital Frequency Synthesizer (DFS)

The DFS component generates clock signals the frequency of which is a product of the clock frequency at the CLKIN input and a ratio of two user-determined integers. Because of the wide range of possible output frequencies such a ratio permits, the DFS feature provides still further flexibility than the DLL's basic synthesis options as described in the preceding section. The DFS component's two dedicated outputs, CLKFX and CLKFX180, are defined in [Table 18](#).

The signal at the CLKFX180 output is essentially an inversion of the CLKFX signal. These two outputs always exhibit a 50% duty cycle. This is true even when the CLKIN signal does not. These DFS clock outputs are driven at the same time as the DLL's seven clock outputs.

The numerator of the ratio is the integer value assigned to the attribute CLKFX\_MULTIPLY and the denominator is the integer value assigned to the attribute CLKFX\_DIVIDE. These attributes are described in [Table 17](#).

The output frequency ( $f_{CLKFX}$ ) can be expressed as a function of the incoming clock frequency ( $f_{CLKIN}$ ) as follows:

$$f_{CLKFX} = f_{CLKIN} * (CLKFX\_MULTIPLY / CLKFX\_DIVIDE) \quad (3)$$

Regarding the two attributes, it is possible to assign any combination of integer values, provided that two conditions are met:

1. The two values fall within their corresponding ranges, as specified in [Table 17](#).
2. The  $f_{CLKFX}$  frequency calculated from the above expression accords with the DCM's operating frequency specifications.

For example, if CLKFX\_MULTIPLY = 5 and CLKFX\_DIVIDE = 3, then the frequency of the output clock signal would be 5/3 that of the input clock signal.

### DFS Frequency Modes

The DFS supports two operating modes, High Frequency and Low Frequency, with each specified over a different clock frequency range. The DFS\_FREQUENCY\_MODE attribute chooses between the two modes. When the attribute is set to LOW, the Low Frequency mode permits

Table 17: DFS Attributes

Attribute	Description	Values
DFS_FREQUENCY_MODE	Chooses between High Frequency and Low Frequency modes	Low, High
CLKFX_MULTIPLY	Frequency multiplier constant	Integer from 2 to 32
CLKFX_DIVIDE	Frequency divisor constant	Integer from 1 to 32

Table 18: DFS Signals

Signal	Direction	Description
CLKFX	Output	Multiplies the CLKIN frequency by the attribute-value ratio (CLKFX_MULTIPLY/CLKFX_DIVIDE) to generate a clock signal with a new target frequency.
CLKFX180	Output	Generates a clock signal with same frequency as CLKFX, only shifted 180° out-of-phase.

the two DFS outputs to operate over a low-to-moderate frequency range. When the attribute is set to HIGH, the High Frequency mode allows both these outputs to operate at the highest possible frequencies.

### DFS With or Without the DLL

The DFS component can be used with or without the DLL component:

Without the DLL, the DFS component multiplies or divides the CLKIN signal frequency according to the respective CLKFX\_MULTIPLY and CLKFX\_DIVIDE values, generating a clock with the new target frequency on the CLKFX and CLKFX180 outputs. Though classified as belonging to the DLL component, the CLKIN input is shared with the DFS component. This case does not employ feedback loop; therefore, it cannot correct for clock distribution delay.

With the DLL, the DFS operates as described in the preceding case, only with the additional benefit of eliminating the clock distribution delay. In this case, a feedback loop from the CLK0 output to the CLKFB input must be present.

The DLL and DFS components work together to achieve this phase correction as follows: Given values for the CLKFX\_MULTIPLY and CLKFX\_DIVIDE attributes, the DLL selects the delay element for which the output clock edge coincides with the input clock edge whenever mathematically possible. For example, when CLKFX\_MULTIPLY = 5 and CLKFX\_DIVIDE = 3, the input and output clock edges will coincide every three input periods, which is equivalent in time to five output periods.

Smaller CLKFX\_MULTIPLY and CLKFX\_DIVIDE values achieve faster lock times. With no factors common to the two attributes, alignment will occur once with every number of cycles equal to the CLKFX\_DIVIDE value. Therefore, it is recommended that the user reduce these values by factoring wherever possible. For example, given CLKFX\_MULTIPLY = 9 and CLKFX\_DIVIDE = 6, removing a factor of three yields CLKFX\_MULTIPLY = 3 and CLKFX\_DIVIDE = 2. While both value-pairs will result in the multiplication of clock frequency by 3/2, the latter value-pair will enable the DLL to lock more quickly.

## DFS Clock Output Connections

There are two basic cases that determine how to connect the DFS clock outputs: on-chip and off-chip, which are illustrated in [Figure 19a](#) and [Figure 19c](#), respectively. This is similar to what has already been described for the DLL component. See the [DLL Clock Output and Feedback Connections](#), page 32 section.

In the on-chip case, it is possible to connect either of the DFS's two output clock signals through general routing resources to the FPGA's internal registers. Either a Global Clock Buffer (BUFG) or a BUFGMUX affords access to the global clock network. The optional feedback loop is formed in this way, routing CLK0 to a global clock net, which in turn drives the CLKFB input.

In the off-chip case, the DFS's two output clock signals, plus CLK0 for an optional feedback loop, can exit the FPGA using output buffers (OBUF) to drive a clock network plus registers on the board. The feedback loop is formed by feeding the CLK0 signal back into the FPGA using an IBUFG, which directly accesses the global clock network, or an IBUF. Then, the global clock net is connected directly to the CLKFB input.

## Phase Shifter (PS)

The DCM provides two approaches to controlling the phase of a DCM clock output signal relative to the CLKIN signal: First, there are nine clock outputs that employ the DLL to achieve a desired phase relationship: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, CLKDV CLKFX, and CLKFX180. These outputs afford "coarse" phase control.

The second approach uses the PS component described in this section to provide a still finer degree of control. The PS component is only available when the DLL is operating in its low-frequency mode. The PS component phase shifts the DCM output clocks by introducing a "fine phase shift" ( $T_{PS}$ ) between the CLKFB and CLKIN signals inside the DLL component. The user can control this fine phase shift down to a resolution of 1/256 of a CLKIN cycle or one tap delay (DCM\_TAP), whichever is greater. When in use, the PS component shifts the phase of all nine DCM clock output signals together. If the PS component is used together with a DCM clock output such as the CLK90, CLK180, CLK270, CLK2X180 and CLKFX180, then the fine phase shift of the former gets added to the coarse phase shift of the latter.

Table 19: PS Attributes

Attribute	Description	Values
CLKOUT_PHASE_SHIFT	Disables PS component or chooses between Fixed Phase and Variable Phase modes.	NONE, FIXED, VARIABLE
PHASE_SHIFT	Determines size and direction of initial fine phase shift.	Integers from -255 to +255 <sup>(1)</sup>

### Notes:

1. The practical range of values will be less when  $T_{CLKIN} > FINE\_SHIFT\_RANGE$  in the Fixed Phase mode, also when  $T_{CLKIN} > (FINE\_SHIFT\_RANGE)/2$  in the Variable Phase mode. the FINE\_SHIFT\_RANGE represents the sum total delay of all taps.

## PS Component Enabling and Mode Selection

The CLKOUT\_PHASE\_SHIFT attribute enables the PS component for use in addition to selecting between two operating modes. As described in [Table 19](#), this attribute has three possible values: NONE, FIXED and VARIABLE. When CLKOUT\_PHASE\_SHIFT is set to NONE, the PS component is disabled and its inputs, PSEN, PSCLK, and PSINCDEC, must be tied to GND. The set of waveforms in [Figure 21a](#) shows the disabled case, where the DLL maintains a zero-phase alignment of signals CLKFB and CLKIN upon which the PS component has no effect. The PS component is enabled by setting the attribute to either the FIXED or VARIABLE values, which select the Fixed Phase mode and the Variable Phase mode, respectively. These two modes are described in the sections that follow

### Determining the Fine Phase Shift

The user controls the phase shift of CLKFB relative to CLKIN by setting and/or adjusting the value of the PHASE\_SHIFT attribute. This value must be an integer ranging from -255 to +255. The PS component uses this value to calculate the desired fine phase shift ( $T_{PS}$ ) as a fraction of the CLKIN period ( $T_{CLKIN}$ ). Given values for PHASE\_SHIFT and  $T_{CLKIN}$ , it is possible to calculate  $T_{PS}$  as follows:

$$T_{PS} = (\text{PHASE\_SHIFT}/256) * T_{CLKIN} \quad (4)$$

Both the Fixed Phase and Variable Phase operating modes employ this calculation. If the PHASE\_SHIFT value is zero, then CLKFB and CLKIN will be in phase, the same as when the PS component is disabled. When the PHASE\_SHIFT value is positive, the CLKFB signal will be shifted later in time with respect to CLKIN. If the attribute value is negative, the CLKFB signal will be shifted earlier in time with respect to CLKIN.

### The Fixed Phase Mode

This mode fixes the desired fine phase shift to a fraction of the  $T_{CLKIN}$ , as determined by Equation (4) and its user-selected PHASE\_SHIFT value P. The set of waveforms in [Figure 21b](#) illustrates the relationship between CLKFB and CLKIN in the Fixed Phase mode. In the Fixed Phase mode, the PSEN, PSCLK and PSINCDEC inputs are not used and must be tied to GND.

a. CLKOUT\_PHASE\_SHIFT = NONE

b. CLKOUT\_PHASE\_SHIFT = FIXED

c. CLKOUT\_PHASE\_SHIFT = VARIABLE

DS099-2\_11\_031303

Notes:

1. P represents the integer value ranging from -255 to +255 to which the PHASE\_SHIFT attribute is assigned.
2. N is an integer value ranging from -255 to +255 that represents the net phase shift effect from a series of increment and/or decrement operations.

$$N = \{\text{Total number of increments}\} - \{\text{Total number of decrements}\}$$

A positive value for N indicates a net increment; a negative value indicates a net decrement.

Figure 21: Phase Shifter Waveforms

Table 20: Signals for Variable Phase Mode

Signal	Direction	Description
PSEN <sup>(1)</sup>	Input	Enables PSCLK for variable phase adjustment.
PSCLK <sup>(1)</sup>	Input	Clock to synchronize phase shift adjustment.
PSINCDEC <sup>(1)</sup>	Input	Chooses between increment and decrement for phase adjustment. It is synchronized to the PSCLK signal.
PSDONE	Output	Goes High to indicate that present phase adjustment is complete and PS component is ready for next phase adjustment request. It is synchronized to the PSCLK signal.

**Notes:**

1. It is possible to program this input for either a true or inverted polarity

**The Variable Phase Mode**

The “Variable Phase” mode dynamically adjusts the fine phase shift over time using three inputs to the PS component, namely PSEN, PSCLK and PSINCDEC, as defined in [Table 20](#).

After device configuration, the PS component initially determines  $T_{PS}$  by evaluating Equation (4) for the value assigned to the PHASE\_SHIFT attribute. Then to dynamically adjust that phase shift, use the three PS inputs to increase or decrease the fine phase shift.

PSINCDEC is synchronized to the PSCLK clock signal, which is enabled by asserting PSEN. It is possible to drive the PSCLK input with the CLKIN signal or any other clock signal. A request for phase adjustment is entered as follows: For each PSCLK cycle that PSINCDEC is High, the PS component adds 1/256 of a CLKIN cycle to  $T_{PS}$ . Similarly, for each enabled PSCLK cycle that PSINCDEC is Low, the PS component subtracts 1/256 of a CLKIN cycle from  $T_{PS}$ . The phase adjustment may require as many as 100 CLKIN cycles plus three PSCLK cycles to take effect, at which

point the output PSDONE goes High for one PSCLK cycle. This pulse indicates that the PS component has finished the present adjustment and is now ready for the next request. Asserting the Reset (RST) input, returns  $T_{PS}$  to its original shift time, as determined by the PHASE\_SHIFT attribute value. The set of waveforms in [Figure 21c](#) illustrates the relationship between CLKFB and CLKIN in the Variable Phase mode.

**The Status Logic Component**

The Status Logic component not only reports on the state of the DCM but also provides a means of resetting the DCM to an initial known state. The signals associated with the Status Logic component are described in [Table 21](#).

As a rule, the Reset (RST) input is asserted only upon configuring the device or changing the CLKIN frequency. A DCM reset does not affect attribute values (e.g., CLKFX\_MULTIPLY and CLKFX\_DIVIDE). If not used, RST must be tied to GND.

The eight bits of the STATUS bus are defined in [Table 22](#).

Table 21: Status Logic Signals

Signal	Direction	Description
RST	Input	A High resets the entire DCM to its initial power-on state. Initializes the DLL taps for a delay of zero. Sets the LOCKED output Low. This input is asynchronous.
STATUS[7:0]	Output	The bit values on the STATUS bus provide information regarding the state of DLL and PS operation
LOCKED	Output	Indicates that the CLKIN and CLKFB signals are in phase by going High. The two signals are out-of-phase when Low.

Table 22: DCM STATUS Bus

Bit	Name	Description
0	Phase Shift Overflow	A value of 1 indicates a phase shift overflow when one of two conditions occurs: <ul style="list-style-type: none"> <li>Incrementing (or decrementing) TPS beyond 255/256 of a CLKIN cycle.</li> <li>The DLL is producing its maximum possible phase shift (i.e., all delay taps are active).<sup>(1)</sup></li> </ul>
1	CLKIN Input Stopped Toggling	A value of 1 indicates that the CLKIN input signal is not toggling. A value of 0 indicates toggling. This bit functions only when the CLKFB input is connected. <sup>(2)</sup>
2	CLKFX/CLKFX180 Output Stopped Toggling	A value of 1 indicates that the CLKFX or CLKFX180 output signals are not toggling. A value of 0 indicates toggling. This bit functions only when using the Digital Frequency Synthesizer (DFS).
3:7	Reserved	-

**Notes:**

- The DLL phase shift with all delay taps active is specified as the parameter FINE\_SHIFT\_RANGE.
- If only the DFS clock outputs are used, but none of the DLL clock outputs, this bit will not go High when the CLKIN signal stops.

Table 23: Status Attributes

Attribute	Description	Values
STARTUP_WAIT	Delays transition from configuration to user mode until lock condition is achieved.	TRUE, FALSE

**Stabilizing DCM Clocks Before User Mode**

It is possible to delay the completion of device configuration until after the DLL has achieved a lock condition using the STARTUP\_WAIT attribute described in Table 23. This option ensures that the FPGA does not enter user mode — i.e., begin functional operation — until all system clocks generated by the DCM are stable. In order to achieve the delay, it is necessary to set the attribute to TRUE as well as set the BitGen option LCK\_cycle to one of the six cycles making up the Startup phase of configuration. The selected cycle defines the point at which configuration will halt until the LOCKED output goes High.

**Global Clock Network**

Spartan-3 devices have eight Global Clock inputs called GCLK0 - GCLK7. These inputs provide access to a low-capacitance, low-skew network that is well-suited to carrying high-frequency signals. The Spartan-3 clock network is shown in Figure 22. GCLK0 through GCLK3 are located in the center of the bottom edge. GCLK4 through GCLK7 are located in the center of the top edge.

Eight Global Clock Multiplexers (also called BUFGMUX elements) are provided that accept signals from Global Clock inputs and route them to the internal clock network as well as DCMs. Four BUFGMUX elements are located in the center of the bottom edge, just above the GCLK0 - GCLK3 inputs. The remaining four BUFGMUX elements are located

in the center of the top edge, just below the GCLK4 - GCLK7 inputs.

Pairs of BUFGMUX elements share global inputs, as shown in Figure 22. For example, the GCLK4 and GCLK5 inputs both potentially connect to BUFGMUX4 and BUFGMUX5 located in the upper right center. A differential clock input uses a pair of GCLK inputs to connect to a single BUFGMUX element.

Each BUFGMUX element, shown in Figure 22, is a 2-to-1 multiplexer that can receive signals from any of the four following sources:

- One of the four Global Clock inputs on the same side of the die — top or bottom — as the BUFGMUX element in use.
- Any of four nearby horizontal Double lines.
- Any of four outputs from the DCM in the right-hand quadrant that is on the same side of the die as the BUFGMUX element in use.
- Any of four outputs from the DCM in the left-hand quadrant that is on the same side of the die as the BUFGMUX element in use.

The multiplexer select line, S, chooses which of the two inputs, I0 or I1, drives the BUFGMUX's output signal, O, as described in Table 24. The switching from one clock to the other is glitchless, and done in such a way that the output High and Low times are never shorter than the shortest High or Low time of either input clock.

Table 24: BUFGMUX Select Mechanism

S Input	O Output
0	I0 Input
1	I1 Input

The two clock inputs can be asynchronous with regard to each other, and the S input can change at any time, except for a short setup time prior to the rising edge of the presently selected clock (I0 or I1). Violating this setup time requirement can result in an undefined runt pulse output.

The BUFG clock buffer primitive drives a single clock signal onto the clock network and is essentially the same element as a BUFGMUX, just without the clock select mechanism. Similarly, the BUFGCE primitive creates an enabled clock buffer using the BUFGMUX select mechanism.

Each BUFGMUX buffers incoming clock signals to two possible destinations:

1. The vertical spine belonging to the same side of the die — top or bottom — as the BUFGMUX element in use. The two spines — top and bottom — each comprise four vertical clock lines, each running from one of the BUFGMUX elements on the same side towards the

center of the die. At the center of the die, clock signals reach the eight-line horizontal spine, which spans the width of the die. In turn, the horizontal spine branches out into a subsidiary clock interconnect that accesses the CLBs.

2. The clock input of either DCM on the same side of the die — top or bottom — as the BUFGMUX element in use.

Use either a BUFGMUX element or a BUFG (Global Clock Buffer) element to place a Global input in the design. For the purpose of minimizing the dynamic power dissipation of the clock network, the Xilinx development software automatically disables all clock line segments that a design does not use.

A global clock line ideally drives clock inputs on the various clocked elements within the FPGA, such as CLB or IOB flip-flops or block RAMs. A global clock line also optionally drives combinatorial inputs. However, doing so provides additional loading on the clock line that might also affect clock jitter. Ideally, drive combinatorial inputs using the signal that also drives the input to the BUFGMUX or BUFG element.

DS099-2\_18\_050505

Figure 22: Spartan-3 Clock Network (Top View)

## Interconnect

Interconnect (or routing) passes signals among the various functional elements of Spartan-3 devices. There are four kinds of interconnect: Long lines, Hex lines, Double lines, and Direct lines.

Long lines connect to one out of every six CLBs (see [Figure 23a](#)). Because of their low capacitance, these lines are well-suited for carrying high-frequency signals with minimal loading effects (e.g. skew). If all eight Global Clock Inputs are already committed and there remain additional clock signals to be assigned, Long lines serve as a good alternative.

Hex lines connect one out of every three CLBs (see [Figure 23b](#)). These lines fall between Long lines and Dou-

ble lines in terms of capability: Hex lines approach the high-frequency characteristics of Long lines at the same time, offering greater connectivity.

Double lines connect to every other CLB (see [Figure 23c](#)). Compared to the types of lines already discussed, Double lines provide a higher degree of flexibility when making connections.

Direct lines afford any CLB direct access to neighboring CLBs (see [Figure 23d](#)). These lines are most often used to conduct a signal from a "source" CLB to a Double, Hex, or Long line and then from the longer interconnect back to a Direct line accessing a "destination" CLB.

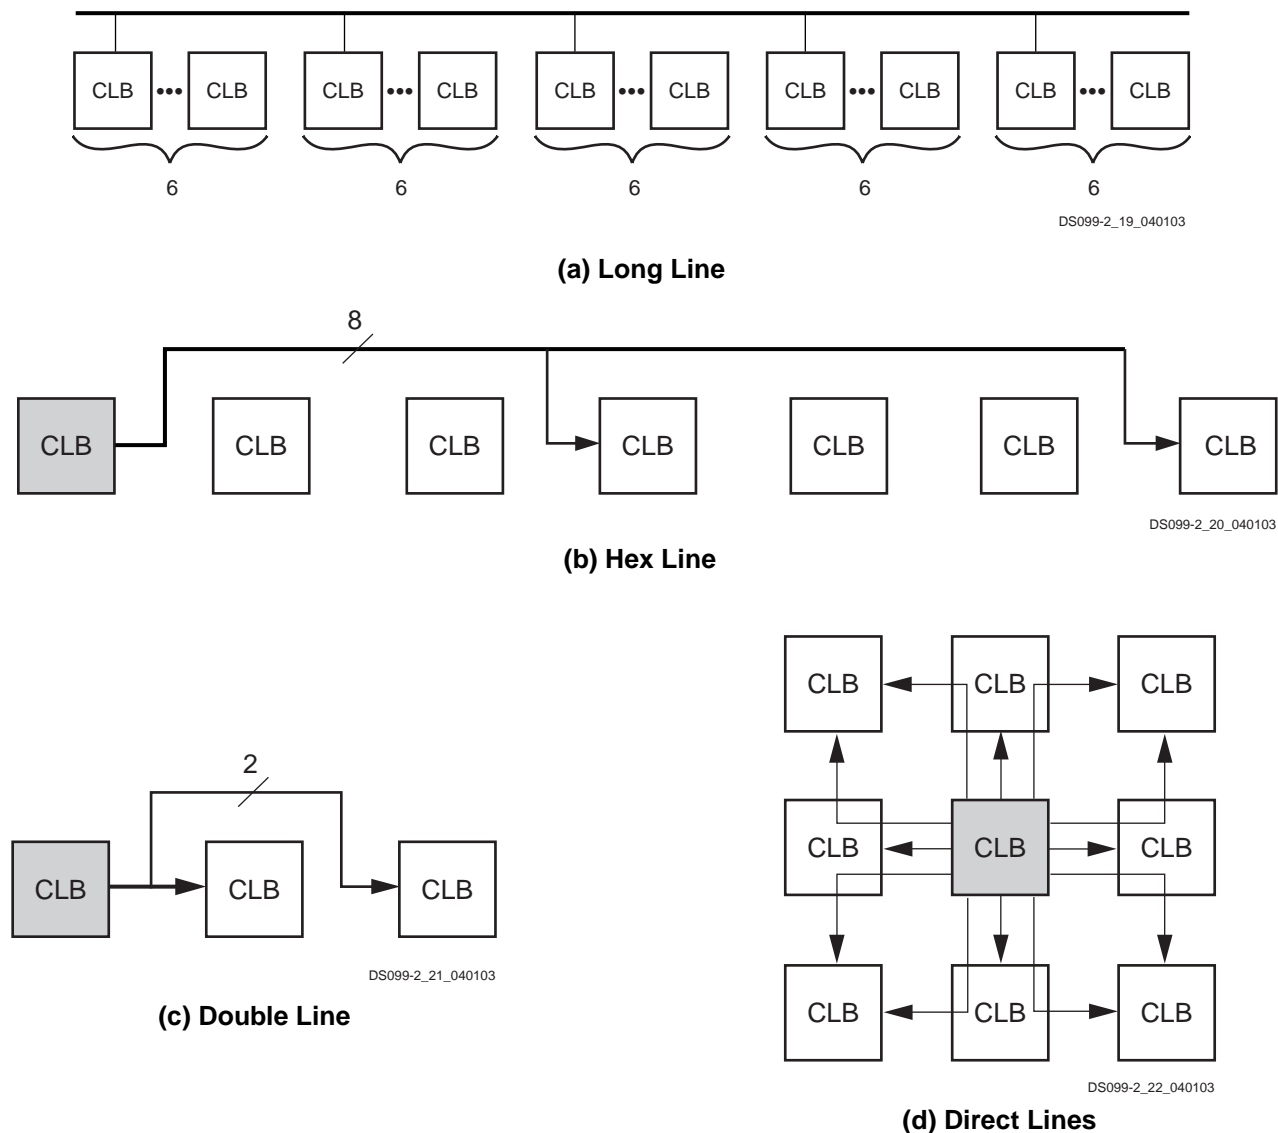

Figure 23: Types of Interconnect

## Configuration

Spartan-3 devices are configured by loading application specific configuration data into the internal configuration memory. Configuration is carried out using a subset of the device pins, some of which are "Dedicated" to one function only, while others, indicated by the term "Dual-Purpose",

can be re-used as general-purpose User I/Os once configuration is complete.

Depending on the system design, several configuration modes are supported, selectable via mode pins. The mode pins M0, M1, and M2 are Dedicated pins. The mode pin settings are shown in [Table 25](#).

Table 25: Spartan-3 Configuration Mode Pin Settings

Configuration Mode <sup>(1)</sup>	M0	M1	M2	Synchronizing Clock	Data Width	Serial DOUT <sup>(2)</sup>
Master Serial	0	0	0	CCLK Output	1	Yes
Slave Serial	1	1	1	CCLK Input	1	Yes
Master Parallel	1	1	0	CCLK Output	8	No
Slave Parallel	0	1	1	CCLK Input	8	No
JTAG	1	0	1	TCK Input	1	No

**Notes:**

1. The voltage levels on the M0, M1, and M2 pins select the configuration mode.
2. The daisy chain is possible only in the Serial modes when DOUT is used.

The HSWAP\_EN input pin defines whether the I/O pins that are not actively used during configuration have pull-up resistors during configuration. By default, HSWAP\_EN is tied High (via an internal pull-up resistor if left floating) which shuts off the pull-up resistors on the user I/O pins during configuration. When HSWAP\_EN is tied Low, user I/Os have pull-ups during configuration. The Dedicated configuration pins (CCLK, DONE, PROG\_B, M2, M1, M0, HSWAP\_EN) and the JTAG pins (TDI, TMS, TCK, and TDO) always have a pull-up resistor to VCCAUX during configuration, regardless of the value on the HSWAP\_EN pin. Similarly, the Dual-purpose INIT\_B pin has an internal pull-up resistor to VCCO\_4 or VCCO\_BOTTOM, depending on the package style.

configuration data is passed via the FPGA's DOUT pin. There is no such limit for JTAG chains.

### The Standard Configuration Interface

Configuration signals belong to one of two different categories: Dedicated or Dual-Purpose. Which category determines which of the FPGA's power rails supplies the signal's driver and, thus, helps describe the electrical at the pin.

The Dedicated configuration pins include PROG\_B, HSWAP\_EN, TDI, TMS, TCK, TDO, CCLK, DONE, and M0-M2. These pins are powered by the VCCAUX supply.

Depending on the chosen configuration mode, the FPGA either generates a CCLK output, or CCLK is an input accepting an externally generated clock.

A persist option is available which can be used to force the configuration pins to retain their configuration function even after device configuration is complete. If the persist option is not selected then the configuration pins with the exception of CCLK, PROG\_B, and DONE can be used as user I/O in normal operation. The persist option does not apply to the boundary-scan related pins. The persist feature is valuable in applications that readback configuration data after entering the User mode.

[Table 26](#) lists the total number of bits required to configure each FPGA as well as the PROMs suitable for storing those bits. See [DS123: Platform Flash In-System Programmable Configuration PROMs](#) data sheet for more information.

Table 26: Spartan-3 Configuration Data

Device	File Sizes	Xilinx Platform Flash PROM	
		Serial Configuration	Parallel Configuration
XC3S50	439,264	XCF01S	XCF08P
XC3S200	1,047,616	XCF01S	XCF08P
XC3S400	1,699,136	XCF02S	XCF08P
XC3S1000	3,223,488	XCF04S	XCF08P
XC3S1500	5,214,784	XCF08P	XCF08P
XC3S2000	7,673,024	XCF08P	XCF08P
XC3S4000	11,316,864	XCF16P	XCF16P
XC3S5000	13,271,936	XCF16P	XCF16P

The Dual-Purpose configuration pins comprise INIT\_B, DOUT, BUSY, RDWR\_B, CS\_B, and DIN/D0-D7. Each of these pins, according to its bank placement, uses the VCCO lines for either Bank 4 (VCCO\_4 on most packages, VCCO\_BOTTOM on TQ144 and CP132 packages) or Bank

5 (VCCO\_5). All the signals used in the serial configuration modes rely on VCCO\_4 power. Signals used in the parallel configuration modes and Readback require from VCCO\_5 as well as from VCCO\_4.

Both the Dedicated signals described above and the Dual-Purpose signals constitute the configuration interface. The Dedicated pins, powered by the 2.5V  $V_{CCAUX}$  supply, always use the LVCMOS25 I/O standard. The Dual-Purpose signals, however, are powered by the VCCO\_4 supply and also by the VCCO\_5 supply in the Parallel configuration modes. The simplest configuration interface uses 2.5V for VCCO\_4 and VCCO\_5, if required. However, VCCO\_4 and, if needed, VCCO\_5 can be voltages other than 2.5V but then the configuration interface will have two voltage levels: 2.5V for  $V_{CCAUX}$  and a separate  $V_{CCO}$  supply. The Dual-Purpose signals default to the LVCMOS input and output levels for the associated  $V_{CCO}$  voltage supply.

### 3.3V-Tolerant Configuration Interface

A 3.3V-tolerant configuration interface simply requires adding a few external resistors as described in detail in "The 3.3V Configuration of Spartan-3 FPGAs" ([XAPP453](#)).

The 3.3V-tolerance is implemented as follows (a similar approach can be used for other supply voltage levels):

Apply 3.3V to VCCO\_4 and, in some configuration modes, to VCCO\_5 to power the Dual-Purpose configuration pins. This scales the output voltages and input thresholds associated with these pins so that they become 3.3V-compatible.

Apply 2.5V to  $V_{CCAUX}$  to power the Dedicated configuration pins. For 3.3V-tolerance, the Dedicated inputs require

series resistors to limit the incoming current to 10 mA or less. The Dedicated outputs have reduced noise margin when the FPGA drives a High logic level into another device's 3.3V receiver. Choose a power regulator or supply that can tolerate reverse current on the  $V_{CCAUX}$  lines.

### Configuration Modes

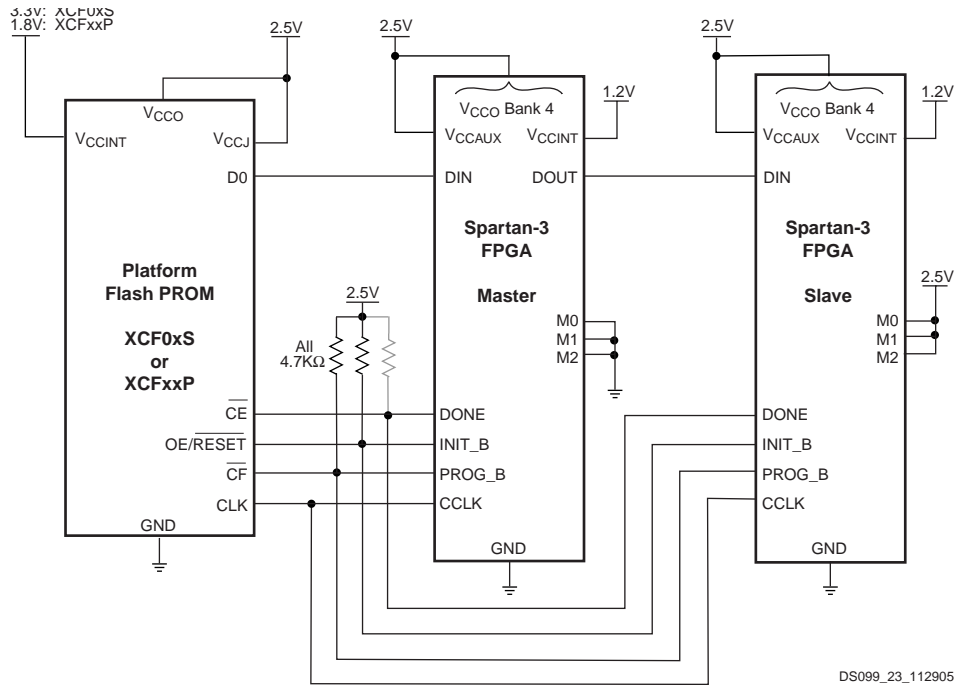

Spartan-3 supports the following five configuration modes:

- Slave Serial mode
- Master Serial mode
- Slave Parallel (SelectMAP) mode
- Master Parallel (SelectMAP) mode
- Boundary-Scan (JTAG) mode (IEEE 1532/IEEE 1149.1)

#### Slave Serial Mode

In Slave Serial mode, the FPGA receives configuration data in bit-serial form from a serial PROM or other serial source of configuration data. The FPGA on the far right of [Figure 24](#) is set for the Slave Serial mode. The CCLK pin on the FPGA is an input in this mode. The serial bitstream must be set up at the DIN input pin a short time before each rising edge of the externally generated CCLK.

Multiple FPGAs can be daisy-chained for configuration from a single source. After a particular FPGA has been configured, the data for the next device is routed internally to the DOUT pin. The data on the DOUT pin changes on the falling edge of CCLK.

DS099\_23\_112905

**Notes:**

1. There are two ways to use the DONE line. First, one may set the BitGen option DriveDone to "Yes" only for the last FPGA to be configured in the chain shown above (or for the single FPGA as may be the case). This enables the DONE pin to drive High; thus, no pull-up resistor is necessary. DriveDone is set to "No" for the remaining FPGAs in the chain. Second, DriveDone can be set to "No" for all FPGAs. Then all DONE lines are open-drain and require the pull-up resistor shown in grey. In most cases, a value between 3.3KΩ to 4.7KΩ is sufficient. However, when using DONE synchronously with a long chain of FPGAs, cumulative capacitance may necessitate lower resistor values (e.g. down to 330Ω) in order to ensure a rise time within one clock cycle.
2. For information on how to program the FPGA using 3.3V signals and power, see **3.3V-Tolerant Configuration Interface**.

Figure 24: Connection Diagram for Master and Slave Serial Configuration

Slave Serial mode is selected by applying <111> to the mode pins (M0, M1, and M2). A pull-up on the mode pins makes slave serial the default mode if the pins are left unconnected.

**Master Serial Mode**

In Master Serial mode, the FPGA drives CCLK pin, which behaves as a bidirectional I/O pin (see **CCLK: Configuration Clock**, page 108). The FPGA in the center of Figure 24 is set for Master Serial mode and connects to the serial configuration PROM and to the CCLK inputs of any slave FPGAs in a configuration daisy-chain. The master FPGA drives the configuration clock on the CCLK pin to the Xilinx Serial PROM, which, in response, provides bit-serial data to the FPGA's DIN input. The FPGA accepts this data on each rising CCLK edge. After the master FPGA finishes configuring, it passes data on its DOUT pin to the next FPGA device in a daisy-chain. The DOUT data appears after the falling CCLK clock edge.

The Master Serial mode interface is identical to Slave Serial except that an internal oscillator generates the configuration clock (CCLK). A wide range of frequencies can be selected for CCLK, which always starts at a default frequency of

6 MHz. Configuration bits then switch CCLK to a higher frequency for the remainder of the configuration.

**Slave Parallel Mode (SelectMAP)**

The Parallel or SelectMAP modes support the fastest configuration. Byte-wide data is written into the FPGA with a BUSY flag controlling the flow of data. An external source provides 8-bit-wide data, CCLK, an active-Low Chip Select (CS\_B) signal and an active-Low Write signal (RDWR\_B). If BUSY is asserted (High) by the FPGA, the data must be held until BUSY goes Low. Data can also be read using the Slave Parallel mode. If RDWR\_B is asserted, configuration data is read out of the FPGA as part of a readback operation.

After configuration, it is possible to use any of the Multipurpose pins (DIN/D0-D7, DOUT/BUSY, INIT\_B, CS\_B, and RDWR\_B) as User I/Os. To do this, simply set the BitGen option *Persist* to *No* and assign the desired signals to multipurpose configuration pins using the Xilinx development software. Alternatively, it is possible to continue using the configuration port (e.g. all configuration pins taken together) when operating in the User mode. This is accomplished by setting the *Persist* option to *Yes*.

Multiple FPGAs can be configured using the Slave Parallel mode and can be made to start-up simultaneously. **Figure 25** shows the device connections. To configure multiple devices in this way, wire the individual CCLK, Data,

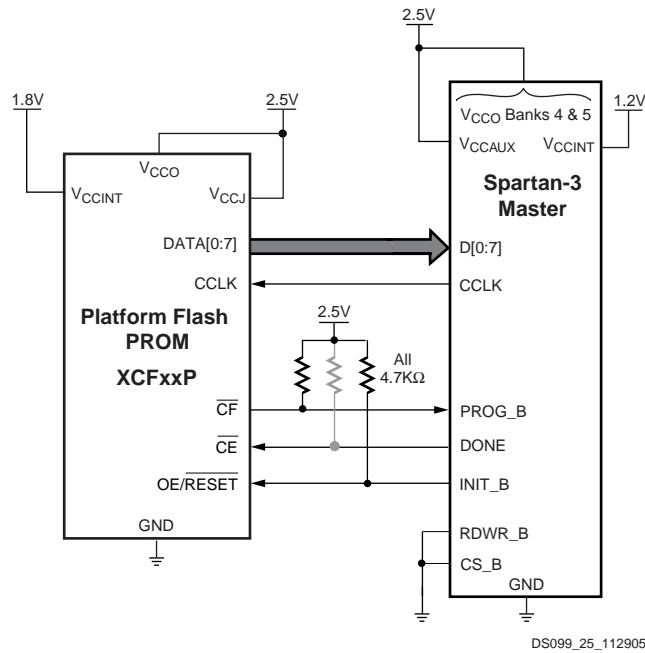

RDWR\_B, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by deasserting the CS\_B pin of each device in turn and writing the appropriate data.

#### Notes:

1. There are two ways to use the DONE line. First, one may set the BitGen option DriveDone to "Yes" only for the last FPGA to be configured in the chain shown above (or for the single FPGA as may be the case). This enables the DONE pin to drive High; thus, no pull-up resistor is necessary. DriveDone is set to "No" for the remaining FPGAs in the chain. Second, DriveDone can be set to "No" for all FPGAs. Then all DONE lines are open-drain and require the pull-up resistor shown in grey. In most cases, a value between 3.3KΩ to 4.7KΩ is sufficient. However, when using DONE synchronously with a long chain of FPGAs, cumulative capacitance may necessitate lower resistor values (e.g. down to 330Ω) in order to ensure a rise time within one clock cycle.
2. If the FPGAs use different configuration data files, configure them in sequence by first asserting the CS\_B of one FPGA then asserting the CS\_B of the other FPGA.
3. For information on how to program the FPGA using 3.3V signals and power, see **3.3V-Tolerant Configuration Interface**.

Figure 25: Connection Diagram for Slave Parallel Configuration

**Notes:**

1. There are two ways to use the DONE line. First, one may set the BitGen option DriveDone to "Yes" only for the last FPGA to be configured in the chain shown above (or for the single FPGA as may be the case). This enables the DONE pin to drive High; thus, no pull-up resistor is necessary. DriveDone is set to "No" for the remaining FPGAs in the chain. Second, DriveDone can be set to "No" for all FPGAs. Then all DONE lines are open-drain and require the pull-up resistor shown in grey. In most cases, a value between 3.3KΩ to 4.7KΩ is sufficient. However, when using DONE synchronously with a long chain of FPGAs, cumulative capacitance may necessitate lower resistor values (e.g. down to 330Ω) in order to ensure a rise time within one clock cycle.

Figure 26: Connection Diagram for Master Parallel Configuration

**Master Parallel Mode**

In this mode, the FPGA configures from byte-wide data, and the FPGA supplies the CCLK configuration clock. In Master configuration modes, CCLK behaves as a bidirectional I/O pin (see **CCLK: Configuration Clock**, page 108). Timing is similar to the Slave Parallel mode except that CCLK is supplied by the FPGA. The device connections are shown in Figure 26.

**Boundary-Scan (JTAG) Mode**

In Boundary-Scan mode, dedicated pins are used for configuring the FPGA. The configuration is done entirely through the IEEE 1149.1 Test Access Port (TAP). FPGA configuration using the Boundary-Scan mode is compliant with the IEEE 1149.1-1993 standard and the new IEEE 1532 standard for In-System Configurable (ISC) devices.

Configuration through the boundary-scan port is always available, regardless of the selected configuration mode. In some cases, however, the mode pin setting may affect proper programming of the device due to various interactions. For example, if the mode pins are set to Master Serial

or Master Parallel mode, and the associated PROM is already programmed with a valid configuration image, then there is potential for configuration interference between the JTAG and PROM data. Selecting the Boundary-Scan mode disables the other modes and is the most reliable mode when programming via JTAG.

**Configuration Sequence**

The configuration of Spartan-3 devices is a three-stage process that occurs after Power-On Reset or the assertion of PROG\_B. POR occurs after the VCCINT, VCCAUX, and VCCO Bank 4 supplies have reached their respective maximum input threshold levels (see Table 28, page 54). After POR, the three-stage process begins.

First, the configuration memory is cleared. Next, configuration data is loaded into the memory, and finally, the logic is activated by a start-up process. A flow diagram for the configuration sequence of the Serial and Parallel modes is shown in Figure 27. The flow diagram for the Boundary-Scan configuration sequence appears in Figure 28.

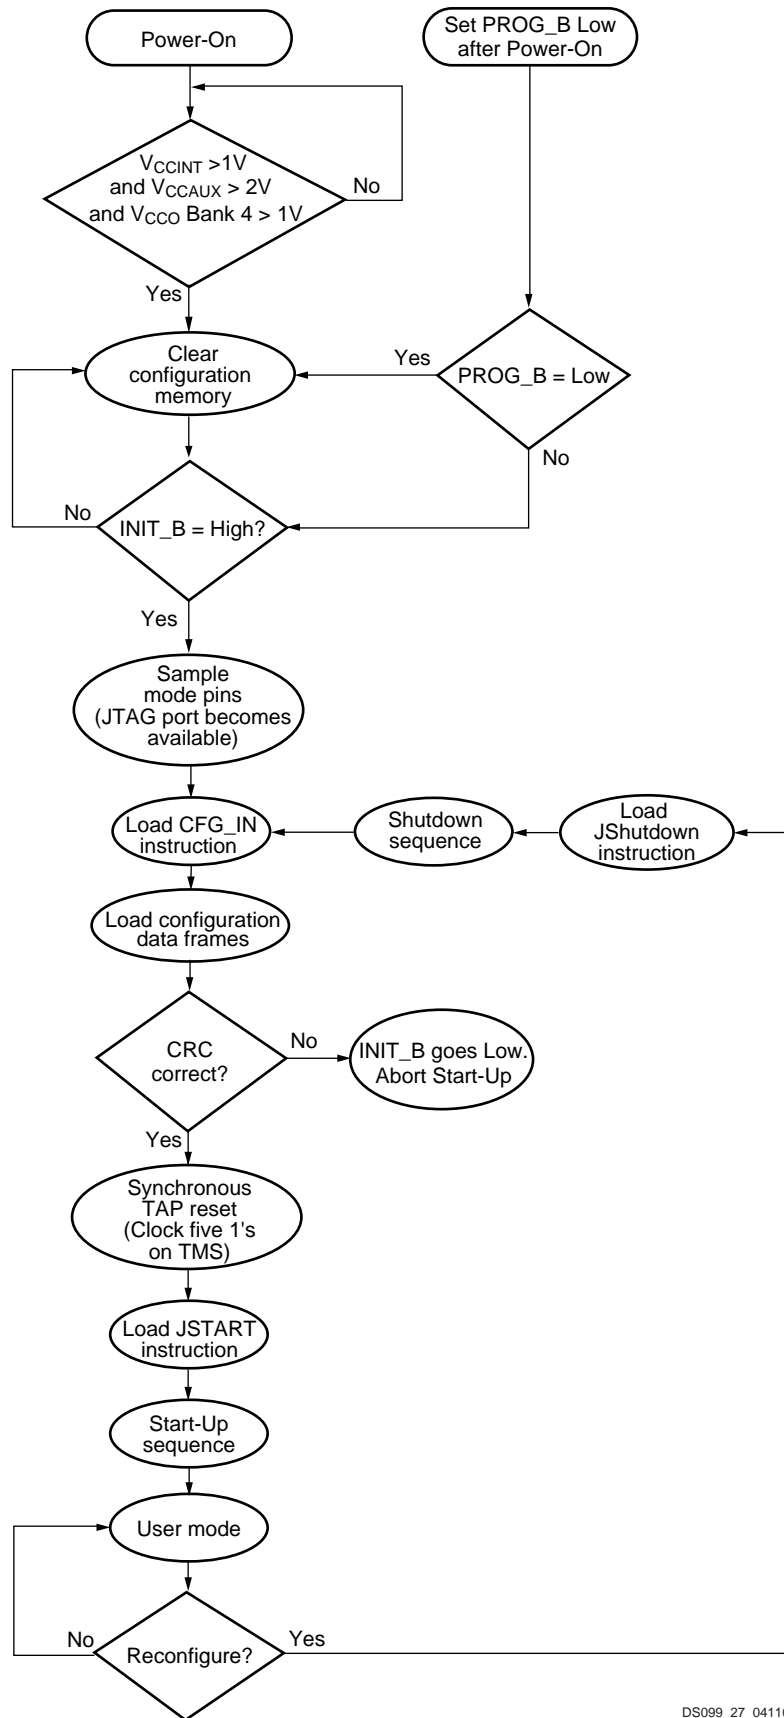

Figure 27: Configuration Flow Diagram for the Serial and Parallel Modes

DS099\_27\_041103

Figure 28: Boundary-Scan Configuration Flow Diagram

Configuration is automatically initiated after power-on unless it is delayed by the user. INIT\_B is an open-drain line that the FPGA holds Low during the clearing of the configuration memory. Extending the time that the pin is Low causes the configuration sequencer to wait. Thus, configuration is delayed by preventing entry into the phase where data is loaded.

The configuration process can also be initiated by asserting the PROG\_B pin. The end of the memory-clearing phase is signaled by the INIT\_B pin going High. At this point, the configuration data is written to the FPGA. The FPGA pulses the Global Set/Reset (GSR) signal at the end of configuration, resetting all flip-flops. The completion of the entire process is signaled by the DONE pin going High.

#### Notes:

1. The BitGen option StartupClk in the Xilinx development software selects the CCLK input, TCK input, or a user-designated clock input (via the STARTUP\_SPARTAN3 primitive) for receiving the clock signal that synchronizes Start-Up.

Figure 29: Default Start-Up Sequence

The default start-up sequence, shown in Figure 29, serves as a transition to the User mode. The default start-up sequence is that one CCLK cycle after DONE goes High, the Global Three-State signal (GTS) is released. This permits device outputs to which signals have been assigned to

become active. One CCLK cycle later, the Global Write Enable (GWE) signal is released. This permits the internal storage elements to begin changing state in response to the design logic and the user clock.

The relative timing of configuration events can be changed via the BitGen options in the Xilinx development software. In addition, the GTS and GWE events can be made dependent on the DONE pins of multiple devices all going High, forcing the devices to start synchronously. The sequence can also be paused at any stage, until lock has been achieved on any DCM.

#### Readback

Using Slave Parallel mode, configuration data from the FPGA can be read back. Readback is supported only in the Slave Parallel and Boundary-Scan modes.

Along with the configuration data, it is possible to read back the contents of all registers, distributed RAM, and block RAM resources. This capability is used for real-time debugging.

#### Additional Configuration Details

Additional details about the Spartan-3 FPGA configuration architecture and command set are available in "Spartan-3 Advanced Configuration Architecture" ([XAPP452](#)).

## Powering Spartan-3 FPGAs

### Voltage Regulators

Various power supply manufacturers offer complete power solutions for Xilinx FPGAs, including some with integrated multi-rail regulators specifically designed for Spartan-3 and Spartan-3E FPGAs. The [Xilinx Power Corner](#) website provides links to vendor solution guides as well as Xilinx power estimation and analysis tools.

### Power Distribution System (PDS) Design and Bypass/Decoupling Capacitors

Good power distribution system (PDS) design is important for all FPGA designs, especially for high-performance applications. Proper design results in better overall performance, lower clock and DCM jitter, and a generally more robust system. Before designing the printed circuit board (PCB) for the FPGA design, review "Power Distribution System (PDS) Design: Using Bypass/Decoupling Capacitors" ([XAPP623](#)).

### Power-On Behavior

Spartan-3 FPGAs have a built-in Power-On Reset (POR) circuit that monitors the three power rails required to successfully configure the FPGA. At power-up, the POR circuit holds the FPGA in a reset state until the  $V_{CCINT}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  Bank 4 supplies reach their respective input threshold levels (see [Table 28, page 54](#)). After all three sup-

plies reach their respective threshold, the POR reset is released and the FPGA begins its configuration process.

Because the three supply inputs must be valid to release the POR reset and can be supplied in any order, there are no specific voltage sequencing requirements. However, applying the FPGA's  $V_{CCAUX}$  supply before the  $V_{CCINT}$  supply uses the least  $I_{CCINT}$  current.

Once all three supplies are valid, the minimum current required to power-on the FPGA is equal to the worst-case quiescent current, as specified in [Table 33, page 58](#). Spartan-3 FPGAs do not require Power-On Surge (POS) current to successfully configure.

### **Surplus $I_{CCINT}$ if $V_{CCINT}$ Applied before $V_{CCAUX}$**

If the  $V_{CCINT}$  supply is applied before the  $V_{CCAUX}$  supply, the FPGA may draw a surplus  $I_{CCINT}$  current in addition to the  $I_{CCINT}$  quiescent current levels specified in [Table 33](#). The momentary additional  $I_{CCINT}$  surplus current might be a few hundred milliamperes under nominal conditions, significantly less than the instantaneous current consumed by the bypass capacitors at power-on. However, the surplus current immediately disappears when the  $V_{CCAUX}$  supply is applied, and, in response, the FPGA's  $I_{CCINT}$  quiescent current demand drops to the levels specified in [Table 33](#). The FPGA does not use nor does it require the surplus current to successfully power-on and configure. If applying  $V_{CCINT}$  before  $V_{CCAUX}$ , ensure that the regulator does not have a foldback feature that could inadvertently shut down in the presence of the surplus current.

### **Maximum Allowed $V_{CCINT}$ Ramp Rate on Early Devices, if $V_{CCINT}$ Supply is Last in Sequence**

Early Spartan-3 FPGAs were produced at a 200 mm wafer production facility and are identified by a fabrication/process code of "FQ" on the device top marking, as shown in [Package Marking, page 7](#). These "FQ" devices have a maximum  $V_{CCINT}$  ramp rate requirement if and only if  $V_{CCINT}$  is the last supply to ramp, after the  $V_{CCAUX}$  and  $V_{CCO}$  Bank 4 supplies. This maximum ramp rate appears as  $T_{CCINT}$  in [Table 29, page 55](#).

Spartan-3 FPGAs ordered with SCD0961 are specially screened to eliminate this  $V_{CCINT}$  ramp rate requirement. All devices with a mask revision code 'E' or later also do not have this  $V_{CCINT}$  ramp rate requirement. Mask revision 'E' devices can be ordered with an SCD0974 code. These devices are standard Spartan-3 product offerings starting August 1, 2005 (see [XCN05009](#)).

### **Minimum Allowed $V_{CCO}$ Ramp Rate on Early Devices**

Initial Spartan-3 FPGA mask revisions have a limit on how fast the  $V_{CCO}$  supply can ramp. The minimum allowed  $V_{CCO}$  ramp rate appears as  $T_{CCO}$  in [Table 29, page 55](#). The

minimum rate is affected by the package inductance. Consequently, the ball grid array and chip-scale packages (CP132, FT256, FG456, FG676, and FG900) allow a faster ramp rate than the quad-flat packages (VQ100, TQ144, and PQ208).

Later devices essentially have no  $V_{CCO}$  ramp rate limits, again shown in [Table 29, page 55](#). Similarly, all devices with a mask revision code 'E' or later do not have a  $V_{CCO}$  ramp rate limit. These devices are standard Spartan-3 product offerings starting August 1, 2005 (see [XCN05009](#)).

## **Configuration Data Retention, Brown-Out**

The FPGA's configuration data is stored in robust CMOS configuration latches. The data in these latches is retained even when the voltages drop to the minimum levels necessary to preserve RAM contents. This is specified in [Table 30, page 55](#).

If, after configuration, the  $V_{CCAUX}$  or  $V_{CCINT}$  supply drops below its data retention voltage, clear the current device configuration using one of the following methods:

- Force the  $V_{CCAUX}$  or  $V_{CCINT}$  supply voltage below the minimum Power On Reset (POR) voltage threshold [Table 28, page 54](#).
- Assert PROG\_B Low.

The POR circuit does not monitor the  $V_{CCO}_4$  supply after configuration. Consequently, dropping the  $V_{CCO}_4$  voltage does not reset the device by triggering a Power-On Reset (POR) event.

## **No Internal Charge Pumps or Free-Running Oscillators**

Some system applications are sensitive to sources of analog noise. Spartan-3 FPGA circuitry is fully static and does not employ internal charge pumps.

The CCLK configuration clock is active during the FPGA configuration process. After configuration completes, the CCLK oscillator is automatically disabled unless the Bitstream Generator (BitGen) option **Persist=Yes**. See Module 4: [Table 79, page 115](#).

Spartan-3 FPGAs optionally support a feature called **Digitally Controlled Impedance (DCI)**. When used in an application, the DCI logic uses an internal oscillator. The DCI logic is only enabled if the FPGA application specifies an I/O standard that requires DCI (LVDCI\_33, LVDCI\_25, etc.). If DCI is not used, the associated internal oscillator is also disabled.

In summary, unless an application uses the **Persist=Yes** option or specifies a DCI I/O standard, an FPGA with no external switching remains fully static.

## Revision History

Date	Version No.	Description
04/11/03	1.0	Initial Xilinx release
05/19/03	1.1	Added Block RAM column, DCMs, and multipliers to XC3S50 descriptions.
07/11/03	1.2	Explained the configuration port <i>Persist</i> option in <b>Slave Parallel Mode (SelectMAP)</b> section. Updated <b>Figure 6</b> and <b>Double-Data-Rate Transmission</b> section to indicate that DDR clocking for the XC3S50 is the same as that for all other Spartan-3 devices. Updated description of I/O voltage tolerance in <b>ESD Protection</b> section. In <b>Table 9</b> , changed input termination type for DCI version of the LVCMOS standard to <i>None</i> . Added additional flexibility for making DLL connections in <b>Figure 19</b> and accompanying text. In the <b>Configuration</b> section, inserted an explanation of how to choose power supplies for the configuration interface, including guidelines for achieving 3.3V-tolerance.
08/24/04	1.3	Showed inversion of 3-state signal ( <b>Figure 5</b> ). Clarified description of pull-up and pull-down resistors ( <b>Table 5</b> and <b>page 14</b> ). Added information on operating block RAM with multipliers to <b>page 23</b> . Corrected output buffer name in <b>Figure 19</b> . Corrected description of how DOUT is synchronized to CCLK ( <b>page 44</b> ).
08/19/05	1.4	Corrected description of WRITE_FIRST and READ_FIRST in <b>Table 12</b> . Added note regarding address setup and hold time requirements whenever a block RAM port is enabled ( <b>Table 12</b> ). Added information in the maximum length of a <b>Configuration</b> daisy-chain. Added reference to <b>XAPP453</b> in <b>3.3V-Tolerant Configuration Interface</b> section. Added information on the STATUS[2] DCM output ( <b>Table 22</b> ). Added information on CCLK behavior and termination recommendations to <b>Configuration</b> . Added <b>Additional Configuration Details</b> section. Added <b>Powering Spartan-3 FPGAs</b> section. Removed GSR from <b>Figure 29</b> because its timing is not programmable.
04/03/06	2.0	Updated <b>Figure 5</b> . Updated <b>Figure 12</b> . Updated <b>Table 9</b> . Updated <b>Figure 20</b> . Corrected Platform Flash supply voltage name and value in <b>Figure 24</b> and <b>Figure 26</b> . Added <b>No Internal Charge Pumps or Free-Running Oscillators</b> . Corrected a few minor typographical errors.
04/26/06	2.1	Added more information on the pull-up resistors that are active during configuration to <b>Configuration</b> . Added information to <b>Boundary-Scan (JTAG) Mode</b> about potential interactions when configuring via JTAG if the mode select pins are set for other than JTAG.

## The Spartan-3 Generation FPGA Family

DS312, [Spartan-3E FPGA Family](#)

DS314-1, [Spartan-3 XA Automotive FPGA Family](#)

## DC Electrical Characteristics

In this section, specifications may be designated as Advance, Preliminary, or Production. These terms are defined as follows:

**Advance:** Initial estimates are based on simulation, early characterization, and/or extrapolation from the characteristics of other families. Values are subject to change. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur. Use as estimates, not for production.

**Preliminary:** Based on complete early silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reported delays is greatly reduced compared to Advance data. Use as estimates, not for production.

**Production:** These specifications are approved only after silicon has been characterized over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Parameter values are considered stable with no future changes expected.

Production-quality systems must only use FPGA designs compiled with a Production status speed file. FPGA designs using a less mature speed file designation should only be used during system prototyping or preproduction qualification. FPGA designs with speed files designated as Preview, Advance, or Preliminary should not be used in a production-quality system.

Whenever a speed file designation changes, as a device matures toward Production status, rerun the [latest Xilinx ISE software](#) on the FPGA design to ensure that the FPGA design incorporates the latest timing information and software updates.

All parameter limits are representative of worst-case supply voltage and junction temperature conditions. **The following applies unless otherwise noted: The parameter values published in this module apply to all Spartan™-3 devices. AC and DC characteristics are specified using the same numbers for both commercial and industrial grades.** All parameters representing voltages are measured with respect to GND.

Some specifications list different values for one or more die or mask revisions, indicated by the device top marking.

If a particular Spartan-3 FPGA differs in functional behavior or electrical characteristic from this data sheet, those differences are described in a separate errata document. The errata notices for Spartan-3 FPGAs are living documents and are available online. Also, create a Xilinx MySupport user account and sign up for automatic E-mail notification whenever this data sheet or an errata notice is updated.

Table 27: Absolute Maximum Ratings

Symbol	Description	Conditions	Min	Max	Units
$V_{CCINT}$	Internal supply voltage relative to GND		-0.5	1.32	V
$V_{CCAUX}$	Auxiliary supply voltage relative to GND		-0.5	3.00	V
$V_{CCO}$	Output driver supply voltage relative to GND		-0.5	3.75	V
$V_{REF}$	Input reference voltage relative to GND		-0.5	$V_{CCO} + 0.5^{(3)}$	V
$V_{IN}^{(2)}$	Voltage applied to all User I/O pins and Dual-Purpose pins relative to GND	Driver in a high-impedance state	-0.5	$V_{CCO} + 0.5^{(3)}$	V
	Voltage applied to all Dedicated pins relative to GND		-0.5	$V_{CCAUX} + 0.5^{(4)}$	V

Table 27: Absolute Maximum Ratings (Continued)

Symbol	Description	Conditions		Min	Max	Units
$V_{ESD}$	Electrostatic Discharge Voltage pins relative to GND	Human body model	XC3S50	-	±1500	V
			Other	-	±2000	V
		Charged device model		-	±500	V
		Machine model		-	±200	V
$T_J$	Junction temperature			-	125	°C
$T_{SOL}$	Soldering temperature			-	220	°C
$T_{STG}$	Storage temperature			-65	150	°C

**Notes:**

- Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time adversely affects device reliability.
- The  $V_{IN}$  limits apply to both the DC and AC components of signals. Simple application solutions are available that show how to handle overshoot/undershoot as well as achieve PCI compliance. Refer to the following application notes: "Virtex™-II Pro and Spartan-3 3.3V PCI Reference Design" ([XAPP653](#)) and "Using 3.3V I/O Guidelines in a Virtex-II Pro Design" ([XAPP659](#)).
- All User I/O and Dual-Purpose pins (DIN/D0, D1–D7, CS\_B, RDWR\_B, BUSY/DOUT, and INIT\_B) draw power from the  $V_{CCO}$  power rail of the associated bank. Meeting the  $V_{IN}$  max limit ensures that the internal diode junctions that exist between each of these pins and the  $V_{CCO}$  rail do not turn on. [Table 31](#) specifies the  $V_{CCO}$  range used to determine the max limit. When  $V_{CCO}$  is at its maximum recommended operating level (3.45V),  $V_{IN}$  max is 3.95V. The maximum voltage that avoids oxide stress is  $V_{INX} = 4.05V$ . As long as the  $V_{IN}$  max specification is met, oxide stress is not possible.
- All Dedicated pins (M0–M2, CCLK, PROG\_B, DONE, HSWAP\_EN, TCK, TDI, TDO, and TMS) draw power from the  $V_{CCAUX}$  rail (2.5V). Meeting the  $V_{IN}$  max limit ensures that the internal diode junctions that exist between each of these pins and the  $V_{CCAUX}$  rail do not turn on. [Table 31](#) specifies the  $V_{CCAUX}$  range used to determine the max limit. When  $V_{CCAUX}$  is at its maximum recommended operating level (2.625V),  $V_{IN}$  max ≤ 3.125V. As long as the  $V_{IN}$  max specification is met, oxide stress is not possible. For information concerning the use of 3.3V signals, see the [3.3V-Tolerant Configuration Interface](#), page 44.
- For soldering guidelines, see "Device Packaging and Thermal Characteristics" ([UG112](#)) and "Implementation and Solder Reflow Guidelines for Pb-Free Packages" ([XAPP427](#)).

Table 28: Supply Voltage Thresholds for Power-On Reset

Symbol	Description	Min	Max	Units
$V_{CCINTT}$	Threshold for the $V_{CCINT}$ supply	0.4	1.0	V
$V_{CCAUXT}$	Threshold for the $V_{CCAUX}$ supply	0.8	2.0	V
$V_{CCO4T}$	Threshold for the $V_{CCO}$ Bank 4 supply	0.4	1.0	V

**Notes:**

- $V_{CCINT}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  supplies may be applied in any order. When applying  $V_{CCINT}$  power before  $V_{CCAUX}$  power, the FPGA may draw a *surplus* current in addition to the quiescent current levels specified in [Table 33](#). Applying  $V_{CCAUX}$  eliminates the surplus current. The FPGA does not use any of the surplus current for the power-on process. For this power sequence, make sure that regulators with foldback features will not shut down inadvertently.
- To ensure successful power-on,  $V_{CCINT}$ ,  $V_{CCO}$  Bank 4, and  $V_{CCAUX}$  supplies must rise through their respective threshold-voltage ranges with no dips at any point.
- If a brown-out condition occurs where  $V_{CCAUX}$  or  $V_{CCINT}$  drops below the retention voltage indicated in [Table 30](#), then  $V_{CCAUX}$  or  $V_{CCINT}$  must drop below the minimum power-on reset voltage in order to clear out the device configuration content.

Table 29: Power Voltage Ramp Time Requirements

Symbol	Description	Top Marking <sup>(2)</sup>	Device	Package	Min	Max	Units
T <sub>CCO</sub>	V <sub>CCO</sub> ramp time for all eight banks	Mask revisions 'A' through 'D'	XC3S50	All	No limit	-	ms
			XC3S200	FT and FG	0.6	-	ms
				Other	2.0	-	ms
			XC3S400	FT and FG	0.6	-	ms
				Other	2.0	-	ms
			XC3S1000	All	No limit	-	
			XC3S1500	All	0.6	-	ms
			XC3S2000	All	No limit	-	
			XC3S4000	All	0.6	-	ms
			XC3S5000	All	No limit	-	
		Mask revisions 'E' or later	All	All	No limit	-	
T <sub>CCINT</sub>	V <sub>CCINT</sub> ramp time, only if V <sub>CCINT</sub> is last in three-rail power-on sequence	Devices with 'FQ' fabrication/process code not specifically ordered with SCD0961	All	All	No limit	500	μs
		Devices with 'GQ' fabrication/process code or parts ordered with SCD0961 or SCD0974 <sup>(6)</sup>	All	All	No limit	-	

**Notes:**

1. If a limit exists, this specification is based on characterization.
2. The mask revision code appears on the device top marking. See [Package Marking, page 7](#).
3. The ramp time is measured from 10% to 90% of the full nominal voltage swing for all I/O standards.
4. For information on power-on current needs, see [Power-On Behavior, page 50](#).
5. Mask revision, fabrication, and process codes appear in [Package Marking, page 7](#). Devices ordered with SCD0961 are specially screened. Devices ordered with SCD0974 or with 'GQ' fabrication/process code are also described in [XCN05009](#).
6. To specifically order mask revision 'E' devices, append "0974" to the standard part number. For example, "XC3S50-4VQ100C" becomes "XC3S50-4VQ100C0974". Mask revision 'E' devices are [errata](#) free and have improved specifications.

Table 30: Power Voltage Levels Necessary for Preserving RAM Contents

Symbol	Description	Min	Units
V <sub>DRINT</sub>	V <sub>CCINT</sub> level required to retain RAM data	1.0	V
V <sub>DRAUX</sub>	V <sub>CCAUX</sub> level required to retain RAM data	2.0	V

**Notes:**

1. RAM contents include data stored in CMOS configuration latches.
2. The level of the V<sub>CCO</sub> supply has no effect on data retention.
3. If a brown-out condition occurs where V<sub>CCAUX</sub> or V<sub>CCINT</sub> drops below the retention voltage, then V<sub>CCAUX</sub> or V<sub>CCINT</sub> must drop below the minimum power-on reset voltage indicated in [Table 28](#) in order to clear out the device configuration content.

Table 31: General Recommended Operating Conditions

Symbol	Description	Min	Nom	Max	Units	
$T_J$	Junction temperature	Commercial	0	25	85	°C
		Industrial	-40	25	100	°C
$V_{CCINT}$	Internal supply voltage	1.140	1.200	1.260	V	
$V_{CCO}^{(1)}$	Output driver supply voltage	1.140	-	3.450	V	
$V_{CCAUX}$	Auxiliary supply voltage	2.375	2.500	2.625	V	
$\Delta V_{CCAUX}^{(2)}$	Voltage variance on $V_{CCAUX}$ when using a DCM	-	-	10	mV/ms	
$V_{IN}^{(2)}$	Voltage applied to all User I/O pins and Dual-Purpose pins relative to GND	$V_{CCO} = 3.3V$	-0.3	-	3.75	V
		$V_{CCO} \leq 2.5V$	-0.3	-	$V_{CCO} + 0.3^{(3)}$	V
	Voltage applied to all Dedicated pins relative to GND		-0.3	-	$V_{CCAUX} + 0.3^{(4)}$	V

**Notes:**

- The  $V_{CCO}$  range given here spans the lowest and highest operating voltages of all supported I/O standards. The recommended  $V_{CCO}$  range specific to each of the single-ended I/O standards is given in Table 34, and that specific to the differential standards is given in Table 36.
- Only during DCM operation is it recommended that the rate of change of  $V_{CCAUX}$  not exceed 10 mV/ms.

Table 32: General DC Characteristics of User I/O, Dual-Purpose, and Dedicated Pins

Symbol	Description	Test Conditions	Min	Typ	Max	Units	
$I_L^{(2)}$	Leakage current at User I/O, Dual-Purpose, and Dedicated pins	Driver is Hi-Z, $V_{IN} = 0V$ or $V_{CCO}$ max, sample-tested	$V_{CCO} \geq 3.0V$	-	-	$\pm 25$	$\mu A$
		$V_{CCO} < 3.0V$	-	-	$\pm 10$	$\mu A$	
$I_{RPU}^{(3)}$	Current through pull-up resistor at User I/O, Dual-Purpose, and Dedicated pins	$V_{IN} = 0V, V_{CCO} = 3.3V$	-0.84	-	-2.35	mA	
		$V_{IN} = 0V, V_{CCO} = 3.0V$	-0.69	-	-1.99	mA	
		$V_{IN} = 0V, V_{CCO} = 2.5V$	-0.47	-	-1.41	mA	
		$V_{IN} = 0V, V_{CCO} = 1.8V$	-0.21	-	-0.69	mA	
		$V_{IN} = 0V, V_{CCO} = 1.5V$	-0.13	-	-0.43	mA	
		$V_{IN} = 0V, V_{CCO} = 1.2V$	-0.06	-	-0.22	mA	
$R_{PU}^{(3)}$	Equivalent resistance of pull-up resistor at User I/O, Dual-Purpose, and Dedicated pins, derived from $I_{RPU}$	$V_{CCO} = 3.0V$ to $3.45V$	1.27	-	4.11	k $\Omega$	
		$V_{CCO} = 2.3V$ to $2.7V$	1.15	-	3.25	k $\Omega$	
		$V_{CCO} = 1.7V$ to $1.9V$	2.45	-	9.10	k $\Omega$	
		$V_{CCO} = 1.4V$ to $1.6V$	3.25	-	12.10	k $\Omega$	
		$V_{CCO} = 1.14$ to $1.26V$	5.15	-	21.00	k $\Omega$	
$I_{RPD}^{(3)}$	Current through pull-down resistor at User I/O, Dual-Purpose, and Dedicated pins	$V_{IN} = V_{CCO}$	0.37	-	1.67	mA	
$R_{PD}^{(3)}$	Equivalent resistance of pull-down resistor at User I/O, Dual-Purpose, and Dedicated pins, driven from $I_{RPD}$	$V_{IN} = V_{CCO} = 3.0V$ to $3.45V$	1.75	-	9.35	k $\Omega$	
		$V_{IN} = V_{CCO} = 2.3V$ to $2.7V$	1.35	-	7.30	k $\Omega$	
		$V_{IN} = V_{CCO} = 1.7V$ to $1.9V$	1.00	-	5.15	k $\Omega$	
		$V_{IN} = V_{CCO} = 1.4V$ to $1.6V$	0.85	-	4.35	k $\Omega$	
		$V_{IN} = V_{CCO} = 1.14$ to $1.26V$	0.68	-	3.45	k $\Omega$	
$R_{DCI}$	Value of external reference resistor to support DCI I/O standards		20	-	100	$\Omega$	

Table 32: General DC Characteristics of User I/O, Dual-Purpose, and Dedicated Pins (Continued)

Symbol	Description	Test Conditions	Min	Typ	Max	Units
$I_{REF}$	$V_{REF}$ current per pin	$V_{CCO} \geq 3.0V$	-	-	$\pm 25$	$\mu A$
		$V_{CCO} < 3.0V$	-	-	$\pm 10$	$\mu A$
$C_{IN}$	Input capacitance		3	-	10	pF

**Notes:**

- The numbers in this table are based on the conditions set forth in Table 31.
- The  $I_L$  specification applies to every I/O pin throughout power-on as long as the voltage on that pin stays between the absolute  $V_{IN}$  minimum and maximum values (Table 27). For hot-swap applications, at the time of card connection, be sure to keep all I/O voltages within this range before applying  $V_{CCO}$  power. Consider applying  $V_{CCO}$  power before connecting the signal lines, to avoid turning on the ESD protection diodes, shown in Module 2: Figure 5, page 12. When the FPGA is completely unpowered, the I/O pins are high impedance, but there is a path through the upper and lower ESD protection diodes.
- This parameter is based on characterization. The pull-up resistance  $R_{PU} = V_{CCO} / I_{RPU}$ . The pull-down resistance  $R_{PD} = V_{IN} / I_{RPD}$ . Spartan-3 family values for both resistances are stronger than they have been for previous FPGA families.

Table 33: Quiescent Supply Current Characteristics

Symbol	Description	Device	Typical <sup>(1)</sup>	Commercial Maximum <sup>(1)</sup>	Industrial Maximum <sup>(1)</sup>	Units
I <sub>CCINTQ</sub>	Quiescent V <sub>CCINT</sub> supply current	XC3S50	5	30	50	mA
		XC3S200	10	80	125	mA
		XC3S400	15	115	180	mA
		XC3S1000	35	200	315	mA
		XC3S1500	45	260	410	mA
		XC3S2000	60	450	650	mA
		XC3S4000	100	810	1200	mA
		XC3S5000	120	990	1450	mA
I <sub>CCOQ</sub>	Quiescent V <sub>CCO</sub> supply current	XC3S50	1.5	10	12	mA
		XC3S200	1.5	10	12	mA
		XC3S400	1.5	12	14	mA
		XC3S1000	2.0	12	14	mA
		XC3S1500	2.5	14	16	mA
		XC3S2000	3.0	16	19	mA
		XC3S4000	3.5	18	22	mA
		XC3S5000	3.5	18	22	mA
I <sub>CCAUXQ</sub>	Quiescent V <sub>CCAUX</sub> supply current	XC3S50	7	20	22	mA
		XC3S200	10	30	33	mA
		XC3S400	15	40	44	mA
		XC3S1000	20	50	55	mA
		XC3S1500	35	75	85	mA
		XC3S2000	45	90	100	mA
		XC3S4000	55	110	125	mA
		XC3S5000	70	130	145	mA

**Notes:**

- The numbers in this table are based on the conditions set forth in Table 31. Quiescent supply current is measured with all I/O drivers in a high-impedance state and with all pull-up/pull-down resistors at the I/O pads disabled. Typical values are characterized using devices with typical processing at ambient room temperature (T<sub>A</sub> of 25°C at V<sub>CCINT</sub> = 1.2V, V<sub>CCO</sub> = 3.3V, and V<sub>CCAUX</sub> = 2.5V). Maximum values are the production test limits measured for each device at the maximum specified junction temperature and at maximum voltage limits with V<sub>CCINT</sub> = 1.26V, V<sub>CCO</sub> = 3.45V, and V<sub>CCAUX</sub> = 2.625V. The FPGA is programmed with a "blank" configuration data file (i.e., a design with no functional elements instantiated). For conditions other than those described above, (e.g., a design including functional elements, the use of DCI standards, etc.), measured quiescent current levels may be different than the values in the table. Use the Web Power Tool or XPower for more accurate estimates. See Note 2.
- There are two recommended ways to estimate the total power consumption (quiescent plus dynamic) for a specific design: a) The Spartan-3 Web Power Tool at [http://www.xilinx.com/ise/power\\_tools](http://www.xilinx.com/ise/power_tools) provides quick, approximate, typical estimates, and does not require a netlist of the design. b) XPower, part of the Xilinx ISE development software, uses the FPGA netlist as input to provide more accurate maximum and typical estimates.
- The maximum numbers in this table also indicate the minimum current each power rail requires in order for the FPGA to power-on successfully, once all three rails are supplied. If V<sub>CCINT</sub> is applied before V<sub>CCAUX</sub>, there may be temporary additional I<sub>CCINT</sub> current until V<sub>CCAUX</sub> is applied. See **Surplus I<sub>CCINT</sub> if V<sub>CCINT</sub> Applied before V<sub>CCAUX</sub>**, page 51.

Table 34: Recommended Operating Conditions for User I/Os Using Single-Ended Standards

Signal Standard (IOSTANDARD)	V <sub>CCO</sub>			V <sub>REF</sub>			V <sub>IL</sub>	V <sub>IH</sub>
	Min (V)	Nom (V)	Max (V)	Min (V)	Nom (V)	Max (V)	Max (V)	Min (V)

**Notes:**

- Descriptions of the symbols used in this table are as follows:  
 V<sub>CCO</sub> — the supply voltage for output drivers as well as LVC<sub>MOS</sub>, LVTTTL, and PCI inputs  
 V<sub>REF</sub> — the reference voltage for setting the input switching threshold  
 V<sub>IL</sub> — the input voltage that indicates a Low logic level  
 V<sub>IH</sub> — the input voltage that indicates a High logic level
- For device operation, the maximum signal voltage (V<sub>IH</sub> max) may be as high as V<sub>IN</sub> max. See [Table 27](#).
- Because the GTL and GTLP standards employ open-drain output buffers, V<sub>CCO</sub> lines do not supply current to the I/O circuit, rather this current is provided using an external pull-up resistor connected from the I/O pin to a termination voltage (V<sub>TT</sub>). Nevertheless, the voltage applied to the associated V<sub>CCO</sub> lines must always be at or above V<sub>TT</sub> and I/O pad voltages.
- There is approximately 0 to 100 mV of hysteresis on inputs using any LVC<sub>MOS</sub> standard.
- All Dedicated pins (M0-M2, CCLK, PROG\_B, DONE, HSWAP\_EN, TCK, TDI, TDO, and TMS) use the LVC<sub>MOS</sub>25 standard and draw power from the V<sub>CCAUX</sub> rail (2.5V). The Dual-Purpose configuration pins (DIN/D0, D1-D7, CS\_B, RDWR\_B, BUSY/DOUT, and INIT\_B) use the LVC<sub>MOS</sub>25 standard before the User mode. For these pins, apply 2.5V to the V<sub>CCO</sub> Bank 4 and V<sub>CCO</sub> Bank 5 rails at power-on as well as throughout configuration. For information concerning the use of 3.3V signals, see the [3.3V-Tolerant Configuration Interface, page 44](#).
- The Global Clock Inputs (GCLK0-GCLK7) are Dual-Purpose pins to which any signal standard may be assigned.
- For more information, see "Virtex-II Pro and Spartan-3 3.3V PCI Reference Design" ([XAPP653](#)).

SSTL2_II_DCI <sup>(7)</sup>		Note 3	Note 3		

**Notes:**

- The numbers in this table are based on the conditions set forth in [Table 31](#) and [Table 34](#).
- Descriptions of the symbols used in this table are as follows:  
 I<sub>OL</sub> – the output current condition under which V<sub>OL</sub> is tested  
 I<sub>OH</sub> – the output current condition under which V<sub>OH</sub> is tested  
 V<sub>OL</sub> – the output voltage that indicates a Low logic level  
 V<sub>OH</sub> – the output voltage that indicates a High logic level  
 V<sub>IL</sub> – the input voltage that indicates a Low logic level  
 V<sub>IH</sub> – the input voltage that indicates a High logic level  
 V<sub>CCO</sub> – the supply voltage for output drivers as well as LVCMOS, LVTTTL, and PCI inputs  
 V<sub>REF</sub> – the reference voltage for setting the input switching threshold  
 V<sub>TT</sub> – the voltage applied to a resistor termination
- Tested according to the standard's relevant specifications. When using the DCI version of a standard on a given I/O bank, that bank will consume more power than if the non-DCI version had been used instead. The additional power is drawn for the purpose of impedance-matching at the I/O pins. A portion of this power is dissipated in the two R<sub>REF</sub> resistors.
- For the LVCMOS and LVTTTL standards: the same V<sub>OL</sub> and V<sub>OH</sub> limits apply for both the Fast and Slow slew attributes.
- All Dedicated output pins (CCLK, DONE, and TDO) as well as Dual-Purpose totem-pole output pins (D0-D7 and BUSY/DOUT) exhibit the characteristics of LVCMOS25 with 12 mA drive and Fast slew rate. For information concerning the use of 3.3V signals, see the [3.3V-Tolerant Configuration Interface](#), page 44.
- Tested according to the relevant PCI specifications. For more information, see "Virtex-II Pro and Spartan-3 3.3V PCI Reference Design" ([XAPP653](#)).

Figure 30: Differential Input Voltages

Table 36: Recommended Operating Conditions for User I/Os Using Differential Signal Standards

Signal Standard (IOSTANDARD)	$V_{CCO}^{(1)}$			$V_{ID}$			$V_{ICM}$			$V_{IH}$		$V_{IL}$	
	Min (V)	Nom (V)	Max (V)	Min (mV)	Nom (mV)	Max (mV)	Min (V)	Nom (V)	Max (V)	Min (V)	Max (V)	Min (V)	Max (V)
LDT_25 (ULVDS_25)	2.375	2.50	2.625	200	600	1000	0.44	0.60	0.78	-	-	-	-
LVDS_25, LVDS_25_DCI	2.375	2.50	2.625	100	350	600	0.30	1.25	2.20	-	-	-	-
BLVDS_25	2.375	2.50	2.625	-	350	-	-	1.25	-	-	-	-	-
LVDS_EXT_25, LVDS_EXT_25_DCI	2.375	2.50	2.625	100	540	1000	0.30	1.20	2.20	-	-	-	-
LVPECL_25	2.375	2.50	2.625	100	-	-	0.30	1.20	2.20	0.8	2.0	0.5	1.7
RSDS_25	2.375	2.50	2.625	100	200	-	-	1.20	-	-	-	-	-
DIFF_HSTL_II_18, DIFF_HSTL_II_18_DCI	1.70	1.80	1.90	200	-	-	0.80	-	1.00	-	-	-	-
DIFF_SSTL2_II, DIFF_SSTL2_II_DCI	2.375	2.50	2.625	300	-	-	1.05	-	1.45	-	-	-	-

**Notes:**

- $V_{CCO}$  only supplies differential output drivers, not input circuits.
- $V_{REF}$  inputs are not used for any of the differential I/O standards.
- $V_{ID}$  is a differential measurement.

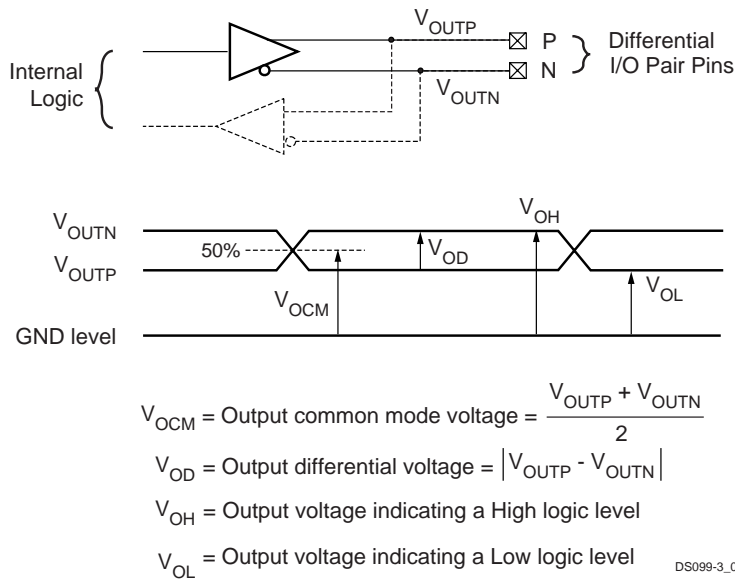

Figure 31: Differential Output Voltages

Table 37: DC Characteristics of User I/Os Using Differential Signal Standards

Signal Standard	Mask <sup>(1)</sup> Revision	V <sub>OD</sub>			V <sub>OCM</sub>			V <sub>OH</sub>	V <sub>OL</sub>
		Min (mV)	Typ (mV)	Max (mV)	Min (V)	Typ (V)	Max (V)	Min (V)	Max (V)
LDT_25 (ULVDS_25)	All	430 <sup>(3)</sup>	600	670	0.495	0.600	0.715	0.71	0.50
LVDS_25	All	100	-	600	0.80	-	1.6	0.85	1.55
	'E'	200	-	500	1.0	-	1.5	1.10	1.40
BLVDS_25 <sup>(6)</sup>	All	250	350	450	-	1.20	-	-	-
LVDSEXT_25	All	100	-	600	0.80	-	1.6	0.85	1.55
	'E'	300	-	700	1.0	-	1.5	1.15	1.35
LVPECL_25 <sup>(6)</sup>	All	-	-	-	-	-	-	1.35	1.005
RSDS_25 <sup>(5)</sup>	All	100	-	600	0.80	-	1.6	0.85	1.55
	'E'	200	-	500	1.0	-	1.5	1.10	1.40
DIFF_HSTL_II_18	All	-	-	-	-	-	-	V <sub>CC0</sub> - 0.40	0.40
DIFF_SSTL2_II	All	-	-	-	-	-	-	V <sub>TT</sub> + 0.80	V <sub>TT</sub> - 0.80

**Notes:**

1. The mask revision code appears on the device top marking. See **Package Marking, page 7**. Mask revision 'E' devices have tighter output ranges but can be used in any design created using a previous revision.
2. The numbers in this table are based on the conditions set forth in **Table 31** and **Table 36**.
3. This value must be compatible with the receiver to which the FPGA's output pair is connected.
4. Output voltage measurements for all differential standards are made with a termination resistor (R<sub>T</sub>) of 100Ω across the N and P pins of the differential signal pair.
5. If the RSDS\_25 I/O standard is used within a specific I/O bank, then no LDT\_25, LVDS\_25, LVDSEXT\_25 differential outputs may share that bank.
6. Each LVPECL\_25 or BLVDS\_25 output-pair requires three external resistors for proper output operation as shown in **Figure 32**. Each LVPECL\_25 or BLVDS\_25 input-pair uses a 100Ω termination resistor at the receiver.

Figure 32: External Termination Required for LVPECL and BLVDS Output and Input

## Switching Characteristics

All Spartan-3 devices are available in two speed grades: –4 and the higher performance –5. Switching characteristics in this document may be designated as Advance, Preliminary, or Production. Each category is defined as follows:

**Advance:** These specifications are based on simulations only and are typically available soon after establishing FPGA specifications. Although speed grades with this designation are considered relatively stable and conservative, some under-reported delays may still occur.

**Preliminary:** These specifications are based on complete early silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting preliminary delays is greatly reduced compared to Advance data.

**Production:** These specifications are approved once enough production silicon of a particular device family member has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

Production-quality systems must use FPGA designs compiled using a Production status speed file. FPGAs designs using a less mature speed file designation may only be used during system prototyping or preproduction qualification. FPGA designs using Advance or Preliminary status speed files should never be used in a production-quality system.

Whenever a speed file designation changes, as a device matures toward Production status, rerun the Xilinx ISE software on the FPGA design to ensure that the FPGA design incorporates the latest timing information and software updates.

- **Xilinx ISE Software Updates**  
[http://www.xilinx.com/xlnx/xil\\_sw\\_updates\\_home.jsp](http://www.xilinx.com/xlnx/xil_sw_updates_home.jsp)

All specified limits are representative of worst-case supply voltage and junction temperature conditions. Unless otherwise noted, the following applies: Parameter values apply to all Spartan-3 devices. All parameters representing voltages are measured with respect to GND.

Selected timing parameters and their representative values are included below either because they are important as general design requirements or they indicate fundamental device performance characteristics. The Spartan-3 v1.38 speed files are the original source for many but not all of the values. The v1.38 speed files are available in Xilinx Integrated Software Environment (ISE) version 8.2i.

The speed grade designations for these files are shown in [Table 38](#). For more complete, more precise, and worst-case data, use the values reported by the Xilinx static timing analyzer (TRACE in the Xilinx development software) and back-annotated to the simulation netlist.

**Table 38: Spartan-3 Speed Grade Designations (ISE v8.2i or later)**

Device	Advance	Preliminary	Production
XC3S50			–4, –5 (v1.37 and later)
XC3S200

XC3S1000			
XC3S1500			
XC3S2000			
XC3S4000			–4, –5 (v1.38 and later)
XC3S5000			

## I/O Timing

Table 39: Pin-to-Pin Clock-to-Output Times for the IOB Output Path

Symbol	Description	Conditions	Device	Speed Grade			Units
				-MIN	-5	-4	
				Min	Max	Max	
<b>Clock-to-Output Times</b>							
T <sub>ICKOFDCM</sub>	When reading from the Output Flip-Flop (OFF), the time from the active transition on the Global Clock pin to data appearing at the Output pin. The DCM is in use.	LVCMOS25 <sup>(2)</sup> , 12mA output drive, Fast slew rate, with DCM <sup>(3)</sup>	<b>XC3S50</b>	0.78	2.04	2.35	ns
			<b>XC3S200</b>	0.58	1.45	1.75	ns
			<b>XC3S400</b>	0.58	1.45	1.75	ns
			<b>XC3S1000</b>	0.79	2.07	2.39	ns
			<b>XC3S1500</b>	0.78	2.05	2.36	ns
			<b>XC3S2000</b>	0.77	2.03	2.34	ns
			<b>XC3S4000</b>	0.74	1.94	2.24	ns
T <sub>ICKOF</sub>	When reading from OFF, the time from the active transition on the Global Clock pin to data appearing at the Output pin. The DCM is not in use.	LVCMOS25 <sup>(2)</sup> , 12mA output drive, Fast slew rate, without DCM	<b>XC3S50</b>	1.40	3.70	4.24	ns
			<b>XC3S200</b>	1.48	3.89	4.46	ns
			<b>XC3S400</b>	1.48	3.91	4.48	ns
			<b>XC3S1000</b>	1.52	4.00	4.59	ns
			<b>XC3S1500</b>	1.54	4.07	4.66	ns
			<b>XC3S2000</b>	1.59	4.19	4.80	ns
			<b>XC3S4000</b>	1.68	4.44	5.09	ns
			<b>XC3S5000</b>	1.66	4.38	5.02	ns

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31 and Table 34.
2. This clock-to-output time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or a standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. If the former is true, add the appropriate Input adjustment from Table 43. If the latter is true, add the appropriate Output adjustment from Table 46.
3. DCM output jitter is included in all measurements.

Table 40: System-Synchronous Pin-to-Pin Setup and Hold Times for the IOB Input Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Min	Min	
<b>Setup Times</b>						
$T_{PSDCM}$	When writing to the Input Flip-Flop (IFF), the time from the setup of data at the Input pin to the active transition at a Global Clock pin. The DCM is in use. No Input Delay is programmed.	LVCMOS25 <sup>(2)</sup> , IOBDELAY = NONE, with DCM <sup>(4)</sup>	XC3S50	2.37	2.71	ns
			XC3S200	2.13	2.35	ns
			XC3S400	2.15	2.36	ns
			XC3S1000	2.58	2.95	ns
			XC3S1500	2.55	2.91	ns

			XC3S5000	-2.66	-2.61	ns

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31 and Table 34.
2. This setup time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, *subtract* the appropriate adjustment from Table 43. If this is true of the data Input, *add* the appropriate Input adjustment from the same table.
3. This hold time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, *add* the appropriate Input adjustment from Table 43. If this is true of the data Input, *subtract* the appropriate Input adjustment from the same table. When the hold time is negative, it is possible to change the data before the clock's active edge.
4. DCM output jitter is included in all measurements.

Table 41: Setup and Hold Times for the IOB Input Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Min	Min	
<b>Setup Times</b>						
$T_{IOPICK}$	Time from the setup of data at the Input pin to the active transition at the ICLK input of the Input Flip-Flop (IFF). No Input Delay is programmed.	LVCMOS25 <sup>(2)</sup> , IOBDELAY = NONE	XC3S50	1.65	1.89	ns
			XC3S200	1.37	1.57	ns
			XC3S400	1.37	1.57	ns

			XC3S1500	-0.55	-0.55	ns
			XC3S2000	-0.55	-0.55	ns
			XC3S4000	-0.61	-0.61	ns
			XC3S5000	-0.68	-0.68	ns
$T_{IOICKPD}$	Time from the active transition at the IFF's ICLK input to the point where data must be held at the Input pin. The Input Delay is programmed.	LVCMOS25 <sup>(2)</sup> , IOBDELAY = IFD	XC3S50	-2.74	-2.74	ns
			XC3S200	-3.00	-3.00	ns
			XC3S400	-2.90	-2.90	ns
			XC3S1000	-3.24	-3.24	ns
			XC3S1500	-3.55	-3.55	ns
			XC3S2000	-4.57	-4.57	ns
			XC3S4000	-4.96	-4.96	ns
			XC3S5000	-5.09	-5.09	ns
<b>Set/Reset Pulse Width</b>						
$T_{RPW\_IOB}$	Minimum pulse width to SR control input on IOB		All	0.66	0.76	ns

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31 and Table 34.
2. This setup time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the data Input. If this is true, *add* the appropriate Input adjustment from Table 43.
3. These hold times require adjustment whenever a signal standard other than LVCMOS25 is assigned to the data Input. If this is true, *subtract* the appropriate Input adjustment from Table 43. When the hold time is negative, it is possible to change the data before the clock's active edge.

Table 42: Propagation Times for the IOB Input Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Max	Max	
<b>Propagation Times</b>						
$T_{IOPLI}$	The time it takes for data to travel from the Input pin through the IFF latch to the I output with no input delay programmed	LVCMOS25 <sup>(2)</sup> , IOBDELAY = NONE	<b>XC3S50</b>	2.01	2.31	ns
			<b>XC3S200</b>	1.50	1.72	ns

DIFF_SSTL2_II, DIFF_SSTL2_II_DCI	0.65	0.75	ns

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31, Table 34, and Table 36.
2. These adjustments are used to convert input path times originally specified for the LVC MOS25 standard to times that correspond to other signal standards.

Table 44: Timing for the IOB Output Path

Symbol	Description	Conditions	Device	Speed Grade			Units
				-0	-5	-4	
				Min	Max	Max	
<b>Clock-to-Output Times</b>							
$T_{IOCKP}$	When reading from the Output Flip-Flop (OFF), the time from the active transition at the OTCLK input to data appearing at the Output pin	LVCMOS25 <sup>(2)</sup> , 12mA output drive, Fast slew rate	XC3S200 XC3S400	0.49	1.28	1.47	ns
			XC3S50 XC3S1000 XC3S1500 XC3S2000 XC3S4000 XC3S5000	0.73	1.95	2.24	ns
<b>Propagation Times</b>							
$T_{IOOP}$	The time it takes for data to travel from the IOB's O input to the Output pin	LVCMOS25 <sup>(2)</sup> , 12mA output drive, Fast slew rate	XC3S200 XC3S400	0.49	1.28	1.46	ns
			XC3S50 XC3S1000 XC3S1500 XC3S2000 XC3S4000 XC3S5000	0.73	1.94	2.23	ns
$T_{IOOLP}$	The time it takes for data to travel from the O input through the OFF latch to the Output pin		XC3S200 XC3S400	0.49	1.28	1.47	ns
			XC3S50 XC3S1000 XC3S1500 XC3S2000 XC3S4000 XC3S5000	0.73	1.95	2.24	ns
<b>Set/Reset Times</b>							
$T_{IOSRP}$	Time from asserting the OFF's SR input to setting/resetting data at the Output pin	LVCMOS25 <sup>(2)</sup> , 12mA output drive, Fast slew rate	XC3S200 XC3S400	0.80	2.10	2.41	ns
			XC3S50 XC3S1000 XC3S1500 XC3S2000 XC3S4000 XC3S5000	1.04	2.77	3.18	ns
$T_{IOGSRQ}$	Time from asserting the Global Set Reset (GSR) net to setting/resetting data at the Output pin		All	3.07	8.07	9.28	ns

**Notes:**

- The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31 and Table 34.
- This time requires adjustment whenever a signal standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. When this is true, add the appropriate Output adjustment from Table 46.

Table 45: Timing for the IOB Three-State Path

Symbol	Description	Conditions	Device	Speed Grade			Units
				-0	-5	-4	
				Min	Max	Max	
<b>Synchronous Output Enable/Disable Times</b>							
$T_{IOCKHZ}$	Time from the active transition at the OTCLK input of the Three-state Flip-Flop (TFF) to when the Output pin enters the high-impedance state	LVCMOS25, 12mA output drive, Fast slew rate	All	0.28	0.74	0.85	ns
$T_{IOCKON}^{(2)}$	Time from the active transition at TFF's OTCLK input to when the Output pin drives valid data		All	0.27	0.72	0.82	ns
<b>Asynchronous Output Enable/Disable Times</b>							
$T_{GTS}$	Time from asserting the Global Three State (GTS) net to when the Output pin enters the high-impedance state	LVCMOS25, 12mA output drive, Fast slew rate	XC3S200 XC3S400	2.93	7.71	8.87	ns
			XC3S50 XC3S1000 XC3S1500 XC3S2000 XC3S4000 XC3S5000	3.17	8.38	9.63	ns
<b>Set/Reset Times</b>							
$T_{IOSRHZ}$	Time from asserting TFF's SR input to when the Output pin enters a high-impedance state	LVCMOS25, 12mA output drive, Fast slew rate	All	0.59	1.55	1.78	ns
$T_{IOSRON}^{(2)}$	Time from asserting TFF's SR input at TFF to when the Output pin drives valid data		XC3S200 XC3S400	0.85	2.24	2.57	ns
			XC3S50 XC3S1000 XC3S1500 XC3S2000 XC3S4000 XC3S5000	1.09	2.91	3.34	ns

**Notes:**

- The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31 and Table 34.
- This time requires adjustment whenever a signal standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. When this is true, add the appropriate Output adjustment from Table 46.

Table 46: Output Timing Adjustments for IOB

Convert Output Time from LVC MOS25 with 12mA Drive and Fast Slew Rate to the Following Signal Standard (IOSTANDARD)			Add the Adjustment Below			Units

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 47 and are based on the operating conditions set forth in Table 31, Table 34, and Table 36.
2. These adjustments are used to convert output- and three-state-path times originally specified for the LVC MOS25 standard with 12 mA drive and Fast slew rate to times that correspond to other signal standards. Do not adjust times that measure when outputs go into a high-impedance state.

## Timing Measurement Methodology

When measuring timing parameters at the programmable I/Os, different signal standards call for different test conditions. Table 47 presents the conditions to use for each standard.

The method for measuring Input timing is as follows: A signal that swings between a Low logic level of  $V_L$  and a High logic level of  $V_H$  is applied to the Input under test. Some standards also require the application of a bias voltage to the  $V_{REF}$  pins of a given bank to properly set the input-switching threshold. The measurement point of the Input signal ( $V_M$ ) is commonly located halfway between  $V_L$  and  $V_H$ .

The Output test setup is shown in Figure 33. A termination voltage  $V_T$  is applied to the termination resistor  $R_T$ , the other end of which is connected to the Output. For each standard,  $R_T$  and  $V_T$  generally take on the standard values recommended for minimizing signal reflections. If the standard does not ordinarily use terminations (e.g., LVCMOS,

LVTTL), then  $R_T$  is set to  $1M\Omega$  to indicate an open connection, and  $V_T$  is set to zero. The same measurement point ( $V_M$ ) that was used at the Input is also used at the Output.

ds099-3\_07\_012004

### Notes:

1. The names shown in parentheses are used in the IBIS file.

**Notes:**

1. Descriptions of the relevant symbols are as follows:

 V<sub>REF</sub> — The reference voltage for setting the input switching threshold

 V<sub>ICM</sub> — The common mode input voltage

 V<sub>M</sub> — Voltage of measurement point on signal transition

 V<sub>L</sub> — Low-level test voltage at Input pin

 V<sub>H</sub> — High-level test voltage at Input pin

 R<sub>T</sub> — Effective termination resistance, which takes on a value of 1MΩ when no parallel termination is required

 V<sub>T</sub> — Termination voltage

 2. The load capacitance (C<sub>L</sub>) at the Output pin is 0 pF for all signal standards.

3. According to the PCI specification.

The capacitive load ( $C_L$ ) is connected between the output and GND. *The Output timing for all standards, as published in the speed files and the data sheet, is always based on a  $C_L$  value of zero.* High-impedance probes (less than 1 pF) are used for all measurements. Any delay that the test fixture might contribute to test measurements is subtracted from those measurements to produce the final timing numbers as published in the speed files and data sheet.

### Using IBIS Models to Simulate Load Conditions in Application

IBIS Models permit the most accurate prediction of timing delays for a given application. The parameters found in the IBIS model ( $V_{REF}$ ,  $R_{REF}$ , and  $V_{MEAS}$ ) correspond directly with the parameters used in [Table 47](#),  $V_T$ ,  $R_T$ , and  $V_M$ . Do not confuse  $V_{REF}$  (the termination voltage) from the IBIS model with  $V_{REF}$  (the input-switching threshold) from the table. A fourth parameter,  $C_{REF}$ , is always zero. The four parameters describe all relevant output test conditions. IBIS

models are found in the Xilinx development software as well as at the following link.

[http://www.xilinx.com/xlnx/xil\\_sw\\_updates\\_home.jsp](http://www.xilinx.com/xlnx/xil_sw_updates_home.jsp)

Simulate delays for a given application according to its specific load conditions as follows:

1. Simulate the desired signal standard with the output driver connected to the test setup shown in [Figure 33](#). Use parameter values  $V_T$ ,  $R_T$ , and  $V_M$  from [Table 47](#).  $C_{REF}$  is zero.
2. Record the time to  $V_M$ .
3. Simulate the same signal standard with the output driver connected to the PCB trace with load. Use the appropriate IBIS model (including  $V_{REF}$ ,  $R_{REF}$ ,  $C_{REF}$ , and  $V_{MEAS}$  values) or capacitive value to represent the load.
4. Record the time to  $V_{MEAS}$ .
5. Compare the results of steps 2 and 4. The increase (or decrease) in delay should be added to (or subtracted from) the appropriate Output standard adjustment

## Simultaneously Switching Output Guidelines

This section provides guidelines for the maximum allowable number of Simultaneous Switching Outputs (SSOs). These guidelines describe the maximum number of user I/O pins, of a given output signal standard, that should simultaneously switch in the same direction, while maintaining a safe level of switching noise. Meeting these guidelines for the stated test conditions ensures that the FPGA operates free from the adverse effects of ground and power bounce.

Ground or power bounce occurs when a large number of outputs simultaneously switch in the same direction. The output drive transistors all conduct current to a common voltage rail. Low-to-High transitions conduct to the  $V_{CCO}$  rail; High-to-Low transitions conduct to the GND rail. The resulting cumulative current transient induces a voltage difference across the inductance that exists between the die pad and the power supply or ground return. The inductance is associated with bonding wires, the package lead frame, and any other signal routing inside the package. Other variables contribute to SSO noise levels, including stray inductance on the PCB as well as capacitive loading at receivers. Any SSO-induced voltage consequently affects internal switching noise margins and ultimately signal quality.

Table 48 and Table 49 provide the essential SSO guidelines. For each device/package combination, Table 48 provides the number of equivalent  $V_{CCO}/GND$  pairs. For each

Table 48: Equivalent  $V_{CCO}/GND$  Pairs per Bank

Device	VQ100	CP132 <sup>(1)</sup>	TQ144 <sup>(1)</sup>	PQ208	FT256	FG320	FG456	FG676	FG900	FG1156

XC3S5000	-	-	-	-	-	-	-	-	10	12

### Notes:

1. The  $V_{CCO}$  lines for the pair of banks on each side of the CP132 and TQ144 packages are internally tied together. Each pair of interconnected banks shares three  $V_{CCO}/GND$  pairs. Consequently, the per bank number is 1.5.
2. The information in this table also applies to Pb-free packages.

output signal standard and drive strength, Table 49 recommends the maximum number of SSOs, switching in the same direction, allowed per  $V_{CCO}/GND$  pair within an I/O bank. The Table 49 guidelines are categorized by package style. Multiply the appropriate numbers from Table 48 and Table 49 to calculate the maximum number of SSOs allowed within an I/O bank. Exceeding these SSO guidelines may result in increased power or ground bounce, degraded signal integrity, or increased system jitter.

$$SSO_{MAX}/IO \text{ Bank} = \text{Table 48} \times \text{Table 49}$$

The recommended maximum SSO values assume that the FPGA is soldered on the printed circuit board and that the board uses sound design practices. The SSO values do not apply for FPGAs mounted in sockets, due to the lead inductance introduced by the socket.

The number of SSOs allowed for quad-flat packages (VQ, TQ, PQ) is lower than for ball grid array packages (FG) due to the larger lead inductance of the quad-flat packages. The results for chip-scale packaging (CP132) are better than quad-flat packaging but not as high as for ball grid array packaging. Ball grid array packages are recommended for applications with a large number of simultaneously switching outputs.

**Notes:**

- The numbers in this table are recommendations that assume the FPGA is soldered on a printed circuit board using sound practices. This table assumes the following parasitic factors: combined PCB trace and land inductance per V<sub>CCO</sub> and GND pin of 1.0 nH, receiver capacitive load of 15 pF. Test limits are the V<sub>IL</sub>/V<sub>IH</sub> voltage limits for the respective I/O standard.
- Regarding the SSO numbers for all DCI standards, the R<sub>REF</sub> resistors connected to the V<sub>RN</sub> and V<sub>RP</sub> pins of the FPGA are 50Ω.
- If more than one signal standard is assigned to the I/Os of a given bank, refer to [XAPP689](#): "Managing Ground Bounce in Large FPGAs" for information on how to perform weighted average SSO calculations.
- Results are based on actual silicon testing using an FPGA soldered on a typical printed-circuit board.

## Internal Logic Timing

Table 50: CLB Timing

Symbol	Description	Speed Grade				Units
		-5		-4		
		Min	Max	Min	Max	
<b>Clock-to-Output Times</b>						
$T_{CKO}$	When reading from the FFX (FFY) Flip-Flop, the time from the active transition at the CLK input to data appearing at the XQ (YQ) output	0.24	0.63	0.24	0.72	ns
<b>Setup Times</b>						
$T_{AS}$	Time from the setup of data at the F or G input to the active transition at the CLK input of the CLB	0.46	-	0.53	-	ns
$T_{DICK}$	Time from the setup of data at the BX or BY input to the active transition at the CLK input of the CLB	0.18	-	0.21	-	ns
<b>Hold Times</b>						
$T_{AH}$	Time from the active transition at the CLK input to the point where data is last held at the F or G input	0	-	0	-	ns
$T_{CKDI}$	Time from the active transition at the CLK input to the point where data is last held at the BX or BY input	0.25	-	0.29	-	ns
<b>Clock Timing</b>						
$T_{CH}$	CLB CLK signal High pulse width	0.69	$\infty$	0.79	$\infty$	ns
$T_{CL}$	CLB CLK signal Low pulse width	0.69	$\infty$	0.79	$\infty$	ns
$F_{TOG}$	Maximum toggle frequency (for export control)	-	725	-	630	MHz
<b>Propagation Times</b>						
$T_{ILO}$	The time it takes for data to travel from the CLB's F (G) input to the X (Y) output	0.21	0.53	0.21	0.61	ns
<b>Set/Reset Pulse Width</b>						
$T_{RPW\_CLB}$	The minimum allowable pulse width, High or Low, to the CLB's SR input	0.76	-	0.87	-	ns

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in [Table 31](#).
2. The timing shown is for SLICEM.

Table 51: CLB Distributed RAM Switching Characteristics

Symbol	Description	-5		-4		Units
		Min	Max	Min	Max	
<b>Clock-to-Output Times</b>						
$T_{SHCKO}$	Time from the active edge at the CLK input to data appearing on the distributed RAM output	-	1.87	-	2.15	ns
<b>Setup Times</b>						
$T_{DS}$	Setup time of data at the BX or BY input before the active transition at the CLK input of the distributed RAM	0.46	-	0.52	-	ns
$T_{AS}$	Setup time of the F/G address inputs before the active transition at the CLK input of the distributed RAM	0.46	-	0.53	-	ns
$T_{WS}$	Setup time of the write enable input before the active transition at the CLK input of the distributed RAM	0.33	-	0.37	-	ns
<b>Hold Times</b>						
$T_{DH}, T_{AH}, T_{WH}$	Hold time of the BX, BY data inputs, the F/G address inputs, or the write enable input after the active transition at the CLK input of the distributed RAM	0	-	0	-	ns
<b>Clock Pulse Width</b>						
$T_{WPH}, T_{WPL}$	Minimum High or Low pulse width at CLK input	0.85	-	0.97	-	ns

Table 52: CLB Shift Register Switching Characteristics

Symbol	Description	-5		-4		Units
		Min	Max	Min	Max	
<b>Clock-to-Output Times</b>

<b>Clock Timing</b>						
$T_{BPWH}$	Block RAM CLK signal High pulse width	1.19	$\infty$	1.37	$\infty$	ns
$T_{BPWL}$	Block RAM CLK signal Low pulse width	1.19	$\infty$	1.37	$\infty$	ns

**Notes:**

- The numbers in this table are based on the operating conditions set forth in [Table 31](#).

## Clock Distribution Switching Characteristics

Table 56: Clock Distribution Switching Characteristics

Description	Symbol	Minimum	Maximum		Units
		Speed Grade			
		-MIN	-5	-4	
Global clock buffer (BUFG, BUFGMUX, BUFGCE) I-input to O-output delay	$T_{GIO}$	0.14	0.36	0.41	ns
Global clock multiplexer (BUFGMUX) select S-input setup to I0- and I1-inputs. Same as BUFGCE enable CE-input	$T_{GSI}$	0.20	0.53	0.60	ns

## Digital Clock Manager (DCM) Timing

For specification purposes, the DCM consists of three key components: the Delay-Locked Loop (DLL), the Digital Frequency Synthesizer (DFS), and the Phase Shifter (PS).

Aspects of DLL operation play a role in all DCM applications. All such applications inevitably use the CLKIN and the CLKFB inputs connected to either the CLK0 or the CLK2X feedback, respectively. Thus, specifications in the DLL tables (Table 57 and Table 58) apply to any application that only employs the DLL component. When the DFS and/or the PS components are used together with the DLL, then the specifications listed in the DFS and PS tables (Table 59 through Table 62) supersede any corresponding ones in the DLL tables. DLL specifications that do not change with the

addition of DFS or PS functions are presented in Table 57 and Table 58.

Period jitter and cycle-cycle jitter are two (of many) different ways of characterizing clock jitter. Both specifications describe statistical variation from a mean value.

Period jitter is the worst-case deviation from the average clock period of all clock cycles in the collection of clock periods sampled (usually from 100,000 to more than a million samples for specification purposes). In a histogram of period jitter, the mean value is the clock period.

Cycle-cycle jitter is the worst-case difference in clock period between adjacent clock cycles in the collection of clock periods sampled. In a histogram of cycle-cycle jitter, the mean value is zero.

### Delay-Locked Loop (DLL)

Table 57: Recommended Operating Conditions for the DLL

Symbol		Description	Frequency Mode/ F <sub>CLKIN</sub> Range	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
<b>Input Frequency Ranges</b>								
F <sub>CLKIN</sub>	CLKIN_FREQ_DLL_LF	Frequency for the CLKIN input	Low	18 <sup>(2)</sup>	167 <sup>(3)</sup>	18 <sup>(2)</sup>	167 <sup>(3)</sup>	MHz
	CLKIN_FREQ_DLL_HF		High	48	280 <sup>(3,4)</sup>	48	280 <sup>(3,4)</sup>	MHz
<b>Input Pulse Requirements</b>								
CLKIN_PULSE		CLKIN pulse width as a percentage of the CLKIN period	F <sub>CLKIN</sub> ≤ 100 MHz	40%	60%	40%	60%	-
			F <sub>CLKIN</sub> > 100 MHz	45%	55%	45%	55%	-
<b>Input Clock Jitter Tolerance and Delay Path Variation<sup>(4)</sup></b>								
CLKIN_CYC_JITT_DLL_LF	Cycle-to-cycle jitter at the CLKIN input		Low	-	±300	-	±300	ps
CLKIN_CYC_JITT_DLL_HF			High	-	±150	-	±150	ps
CLKIN_PER_JITT_DLL_LF	Period jitter at the CLKIN input		All	-	±1	-	±1	ns
CLKIN_PER_JITT_DLL_HF								
CLKFB_DELAY_VAR_EXT		Allowable variation of off-chip feedback delay from the DCM output to the CLKFB input	All	-	±1	-	±1	ns

#### Notes:

1. DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
2. The DFS, when operating independently of the DLL, supports lower F<sub>CLKIN</sub> frequencies. See Table 59.
3. To double the maximum effective F<sub>CLKIN</sub> limit, set the CLKIN\_DIVIDE\_BY\_2 attribute to TRUE.
4. Industrial temperature range devices have additional requirements for continuous clocking, as specified in Table 63.
5. CLKIN input jitter beyond these limits may cause the DCM to lose lock.

Table 58: Switching Characteristics for the DLL

Symbol	Description	Frequency Mode / F <sub>CLKIN</sub> Range	Device	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
<b>Output Frequency Ranges</b>								
CLKOUT_FREQ_1X_LF	Frequency for the CLK0, CLK90, CLK180, and CLK270 outputs	Low	All	18	167	18	167	MHz
CLKOUT_FREQ_1X_HF	Frequency for the CLK0 and CLK180 outputs	High		48	280	48	280	MHz
CLKOUT_FREQ_2X_LF <sup>(3)</sup>	Frequency for the CLK2X and CLK2X180 outputs	Low		36	334	36	334	MHz
CLKOUT_FREQ_DV_LF	Frequency for the CLKDV output	Low		1.125	110	1.125	110	MHz
CLKOUT_FREQ_DV_HF		High		3	185	3	185	MHz
<b>Output Clock Jitter<sup>(4)</sup></b>								
CLKOUT_PER_JITT_0	Period jitter at the CLK0 output	All	All	-	±100	-	±100	ps
CLKOUT_PER_JITT_90	Period jitter at the CLK90 output			-	±150	-	±150	ps
CLKOUT_PER_JITT_180	Period jitter at the CLK180 output			-	±150	-	±150	ps
CLKOUT_PER_JITT_270	Period jitter at the CLK270 output			-	±150	-	±150	ps
CLKOUT_PER_JITT_2X	Period jitter at the CLK2X and CLK2X180 outputs			-	±200	-	±200	ps
CLKOUT_PER_JITT_DV1	Period jitter at the CLKDV output when performing integer division			-	±150	-	±150	ps
CLKOUT_PER_JITT_DV2	Period jitter at the CLKDV output when performing non-integer division			-	±300	-	±300	ps
<b>Duty Cycle</b>								
CLKOUT_DUTY_CYCLE_DLL <sup>(5)</sup>	Duty cycle variation for the CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV outputs	All	XC3S50	-	±150	-	±150	ps
			XC3S200	-	±150	-	±150	ps
			XC3S400	-	±250	-	±250	ps
			XC3S1000	-	±400	-	±400	ps
			XC3S1500	-	±400	-	±400	ps
			XC3S2000	-	±400	-	±400	ps
			XC3S4000	-	±400	-	±400	ps
			XC3S5000	-	±400	-	±400	ps
<b>Phase Alignment</b>								
CLKIN_CLKFB_PHASE	Phase offset between the CLKIN and CLKFB inputs	All	All	-	±150	-	±150	ps
CLKOUT_PHASE	Phase offset between any two DLL outputs (except CLK2X and CLK0)			-	±140	-	±140	ps
	Phase offset between the CLK2X and CLK0 outputs			-	±250	-	±250	ps

Table 58: Switching Characteristics for the DLL (Continued)

Symbol	Description	Frequency Mode / $F_{CLKIN}$ Range	Device	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
<b>Lock Time</b>								
LOCK_DLL	When using the DLL alone: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase	$18 \text{ MHz} \leq F_{CLKIN} \leq 30 \text{ MHz}$	All	-	2.88	-	2.88	ms
		$30 \text{ MHz} < F_{CLKIN} \leq 40 \text{ MHz}$		-	2.16	-	2.16	ms
		$40 \text{ MHz} < F_{CLKIN} \leq 50 \text{ MHz}$		-	1.20	-	1.20	ms
		$50 \text{ MHz} < F_{CLKIN} \leq 60 \text{ MHz}$		-	0.60	-	0.60	ms
		$F_{CLKIN} > 60 \text{ MHz}$		-	0.48	-	0.48	ms
<b>Delay Lines</b>								
DCM_TAP	Delay tap resolution	All	All	30.0	60.0	30.0	60.0	ps

**Notes:**

- The numbers in this table are based on the operating conditions set forth in Table 31 and Table 57.
- DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
- Only mask revision 'E' and later devices (see Package Marking, page 7) and all revisions of the XC3S50 and the XC3S1000 support DLL feedback using the CLK2X output. For all other Spartan-3 devices, use feedback from the CLK0 output (instead of the CLK2X output) and set the CLK\_FEEDBACK attribute to 1X.
- Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
- This specification only applies if the attribute DUTY\_CYCLE\_CORRECTION = TRUE.

**Digital Frequency Synthesizer (DFS)**

Table 59: Recommended Operating Conditions for the DFS

Symbol	Description	Frequency Mode	Speed Grade				Units	
			-5		-4			
			Min	Max	Min	Max		
<b>Input Frequency Ranges<sup>(2)</sup></b>								
$F_{CLKIN}$	CLKIN_FREQ_FX	Frequency for the CLKIN input	All	1	280	1	280	MHz
<b>Input Clock Jitter Tolerance<sup>(3)</sup></b>								
CLKIN_CYC_JITT_FX_LF	Cycle-to-cycle jitter at the CLKIN input	Low	-	±300	-	±300	ps	
CLKIN_CYC_JITT_FX_HF		High	-	±150	-	±150	ps	
CLKIN_PER_JITT_FX	Period jitter at the CLKIN input	All	-	±1	-	±1	ns	

**Notes:**

- DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) are used.
- If both DFS and DLL outputs are used on the same DCM, follow the more restrictive CLKIN\_FREQ\_DLL specifications in Table 57.
- CLKIN input jitter beyond these limits may cause the DCM to lose lock.

Table 60: Switching Characteristics for the DFS

Symbol	Description	Frequency Mode	Device	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
<b>Output Frequency Ranges</b>								
CLKOUT_FREQ_FX_LF	Frequency for the CLKFX and CLKFX180 outputs	Low	All	18	210	18	210	MHz
CLKOUT_FREQ_FX_HF		High	Mask revisions 'A' – 'D' <sup>(5)</sup>	210	280	210	280	MHz
			Mask revisions 'E' and later <sup>(5)</sup>	210	326	210	307	MHz
<b>Output Clock Jitter</b>								
CLKOUT_PER_JITT_FX	Period jitter at the CLKFX and CLKFX180 outputs	All	All	Note 3	Note 3	Note 3	Note 3	ps
<b>Duty Cycle<sup>(4)</sup></b>								
CLKOUT_DUTY_CYCLE_FX	Duty cycle precision for the CLKFX and CLKFX180 outputs	All	XC3S50	-	±100	-	±100	ps
			XC3S200	-	±100	-	±100	ps
			XC3S400	-	±250	-	±250	ps
			XC3S1000	-	±400	-	±400	ps
			XC3S1500	-	±400	-	±400	ps
			XC3S2000	-	±400	-	±400	ps
			XC3S4000	-	±400	-	±400	ps
			XC3S5000	-	±400	-	±400	ps
<b>Phase Alignment</b>								
CLKOUT_PHASE	Phase offset between the DFS output and the CLK0 output	All	All	-	±300	-	±300	ps
<b>Lock Time</b>								
LOCK_DLL_FX	When using the DFS in conjunction with the DLL: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase.	All	All	-	10.0	-	10.0	ms
LOCK_FX	When using the DFS without the DLL: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. By asserting the LOCKED signal, the DFS indicates valid CLKFX and CLKFX180 signals.	All	All	-	10.0	-	10.0	ms

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in Table 31 and Table 59.
2. DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) is in use.
3. The Virtex-II Jitter Calculator at [http://www.xilinx.com/applications/web\\_ds\\_v2/jitter\\_calc.htm](http://www.xilinx.com/applications/web_ds_v2/jitter_calc.htm) provides an estimate. Use the DCM Clock Wizard in the ISE software for a Spartan-3 specific number. Jitter number assumes 150 ps of input clock jitter.
4. The CLKFX and CLKFX180 outputs always approximate 50% duty cycles.
5. The mask revision code appears on the device top marking. See [Package Marking, page 7](#).

## Phase Shifter (PS)

Phase Shifter operation is only supported if the DLL is in the Low frequency mode, see [Table 57](#).

**Table 61: Recommended Operating Conditions for the PS in Variable Phase Mode**

Symbol	Description	Device Revision	Frequency Mode/ F <sub>CLKIN</sub> Range	Speed Grade				Units	
				-5		-4			
				Min	Max	Min	Max		
<b>Operating Frequency Ranges</b>									
PSCLK_FREQ (F <sub>PSCLK</sub> )	Frequency for the PSCLK input	All	Low	1	167	1	167	MHz	
<b>Input Pulse Requirements</b>									
PSCLK_PULSE	PSCLK pulse width as a percentage of the PSCLK period	All	Low	F <sub>CLKIN</sub> ≤ 100 MHz	40%	60%	40%	60%	-
				F <sub>CLKIN</sub> > 100 MHz	45%	55%	45%	55%	-

**Table 62: Switching Characteristics for the PS in Variable or Fixed Phase Shift Mode**

Symbol	Description	Frequency Mode/ F <sub>CLKIN</sub> Range	Speed Grade				Units
			-5		-4		
			Min	Max	Min	Max	
<b>Phase Shifting Range</b>							
FINE_SHIFT_RANGE	Phase shift range	Low	-	10.0	-	10.0	ns
<b>Lock Time</b>							
LOCK_DLL_PS	When using the PS in conjunction with the DLL: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase.	18 MHz ≤ F <sub>CLKIN</sub> ≤ 30 MHz	-	3.28	-	3.28	ms
		30 MHz < F <sub>CLKIN</sub> ≤ 40 MHz	-	2.56	-	2.56	ms
		40 MHz < F <sub>CLKIN</sub> ≤ 50 MHz	-	1.60	-	1.60	ms
		50 MHz < F <sub>CLKIN</sub> ≤ 60 MHz	-	1.00	-	1.00	ms
		60 MHz < F <sub>CLKIN</sub> ≤ 165 MHz	-	0.88	-	0.88	ms
LOCK_DLL_PS_FX	When using the PS in conjunction with the DLL and DFS: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase.	Low	-	10.40	-	10.40	ms

### Notes:

- The numbers in this table are based on the operating conditions set forth in [Table 31](#) and [Table 61](#).
- The PS specifications in this table apply when the PS attribute CLKOUT\_PHASE\_SHIFT= VARIABLE or FIXED.

### Miscellaneous DCM Timing

Table 63: Miscellaneous DCM Timing

Symbol	Description	DLL Frequency Mode	Temperature Range		Units
			Commercial	Industrial	
DCM_INPUT_CLOCK_STOP	Maximum duration that the CLKIN and CLKFB signals can be stopped <sup>(1, 2)</sup>	Any	100	100	ms
DCM_RST_PW_MIN	Minimum duration of a RST pulse width	Any	3	3	CLKIN cycles
DCM_RST_PW_MAX <sup>(3)</sup>	Maximum duration of a RST pulse width <sup>(1, 2)</sup>	Low	N/A	N/A	seconds
		High	N/A	10	seconds
DCM_CONFIG_LAG_TIME <sup>(4)</sup>	Maximum duration from V <sub>CCINT</sub> applied to FPGA configuration successfully completed (DONE pin goes High) and clocks applied to DCM DLL <sup>(1, 2)</sup>	Low	N/A	N/A	minutes
		High	N/A	10	minutes

**Notes:**

1. These limits only apply to applications that use the DCM DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV). The DCM DFS outputs (CLKFX, CLKFX180) are unaffected.
2. Industrial-temperature applications that use the DLL in High-Frequency mode must use a continuous or increasing operating frequency. The DLL under these conditions does not support reducing the operating frequency once establishing an initial operating frequency.
3. This specification is equivalent to the Virtex-4 DCM\_RESET specification.
4. This specification is equivalent to the Virtex-4 TCONFIG specification.

## Configuration and JTAG Timing

### Notes:

1. The  $V_{CCINT}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  supplies may be applied in any order.
2. The Low-going pulse on  $PROG\_B$  is optional after power-on but necessary for reconfiguration without a power cycle.
3. The rising edge of  $INIT\_B$  samples the voltage levels applied to the mode pins (M0 - M2).

Figure 34: Waveforms for Power-On and the Beginning of Configuration

Table 64: Power-On Timing and the Beginning of Configuration

Symbol	Description	Device	All Speed Grades		Units
			Min	Max	
$T_{POR}^{(2)}$	The time from the application of $V_{CCINT}$ , $V_{CCAUX}$ , and $V_{CCO}$ Bank 4 supply voltage ramps (whichever occurs last) to the rising transition of the $INIT\_B$ pin	XC3S50	-	5	ms
		XC3S200	-	5	ms
		XC3S400	-	5	ms
		XC3S1000	-	5	ms
		XC3S1500	-	7	ms
		XC3S2000	-	7	ms
		XC3S4000	-	7	ms
		XC3S5000	-	7	ms
$T_{PROG}$	The width of the low-going pulse on the $PROG\_B$ pin	All	0.3	-	$\mu$ s
$T_{PL}^{(2)}$	The time from the rising edge of the $PROG\_B$ pin to the rising transition on the $INIT\_B$ pin	XC3S50	-	2	ms
		XC3S200	-	2	ms
		XC3S400	-	2	ms
		XC3S1000	-	2	ms
		XC3S1500	-	3	ms
		XC3S2000	-	3	ms
		XC3S4000	-	3	ms
		XC3S5000	-	3	ms
$T_{INIT}$	Minimum Low pulse width on $INIT\_B$ output	All	250	-	ns
$T_{ICCK}^{(3)}$	The time from the rising edge of the $INIT\_B$ pin to the generation of the configuration clock signal at the $CCLK$ output pin	All	0.5	4.0	$\mu$ s

### Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 31. This means power must be applied to all  $V_{CCINT}$ ,  $V_{CCO}$ , and  $V_{CCAUX}$  lines.
2. Power-on reset and the clearing of configuration memory occurs during this period.
3. This specification applies only for the Master Serial and Master Parallel modes.

DS099-3\_04\_071604

Figure 35: Waveforms for Master and Slave Serial Configuration

Table 65: Timing for the Master and Slave Serial Configuration Modes

Symbol	Description	Slave/ Master	All Speed Grades		Units
			Min	Max	
<b>Clock-to-Output Times</b>					
T <sub>CCO</sub>	The time from the falling transition on the CCLK pin to data appearing at the DOUT pin	Both	1.5	12.0	ns
<b>Setup Times</b>					
T <sub>DCC</sub>	The time from the setup of data at the DIN pin to the rising transition at the CCLK pin	Both	10.0	-	ns
<b>Hold Times</b>					
T <sub>CCD</sub>	The time from the rising transition at the CCLK pin to the point when data is last held at the DIN pin	Both	0	-	ns
<b>Clock Timing</b>					
T <sub>CCH</sub>	CCLK input pin High pulse width	Slave	5.0	∞	ns
T <sub>CCL</sub>	CCLK input pin Low pulse width		5.0	∞	ns
F <sub>CCSER</sub>	Frequency of the clock signal at the CCLK input pin		No bitstream compression	0	66 <sup>(2)</sup>
		With bitstream compression	0	20	MHz
		During STARTUP phase	0	50	MHz
ΔF <sub>CCSER</sub>	Variation from the CCLK output frequency set using the ConfigRate BitGen option	Master	-50%	+50%	-

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in Table 31.
2. For serial configuration with a daisy-chain of multiple FPGAs, the maximum limit is 25 MHz.

DS099-3\_05\_041103

**Notes:**

- Switching RDWR\_B High or Low while holding CS\_B Low asynchronously aborts configuration.

Figure 36: Waveforms for Master and Slave Parallel Configuration

Table 66: Timing for the Master and Slave Parallel Configuration Modes

Symbol	Description	Slave/ Master	All Speed Grades		Units
			Min	Max	
<b>Clock-to-Output Times</b>					
$T_{SMCKBY}$	The time from the rising transition on the CCLK pin to a signal transition at the BUSY pin	Slave	-	12.0	ns
<b>Setup Times</b>					
$T_{SMDCC}$	The time from the setup of data at the D0-D7 pins to the rising transition at the CCLK pin	Both	10.0	-	ns
$T_{SMCCS}$	The time from the setup of a logic level at the CS_B pin to the rising transition at the CCLK pin		10.0	-	ns
$T_{SMCCW}^{(2)}$	The time from the setup of a logic level at the RDWR_B pin to the rising transition at the CCLK pin		10.0	-	ns

Table 66: Timing for the Master and Slave Parallel Configuration Modes (Continued)

Symbol	Description		Slave/ Master	All Speed Grades		Units	
				Min	Max		
<b>Hold Times</b>

$T_{SMCCS}$	The time from the rising transition at the CCLK pin to the point when a logic level is last held at the CS_B pin			0	-	ns	
$T_{SMWCC}^{(2)}$	The time from the rising transition at the CCLK pin to the point when a logic level is last held at the RDWR_B pin			0	-	ns	
<b>Clock Timing</b>							
$T_{CCH}$	CCLK input pin High pulse width		Slave	5	$\infty$	ns	
$T_{CCL}$	CCLK input pin Low pulse width			5	$\infty$	ns	
$F_{CCPAR}$	Frequency of the clock signal at the CCLK input pin	No bitstream compression		Not using the BUSY pin <sup>(3)</sup>	0	50	MHz
				Using the BUSY pin	0	66	MHz
		With bitstream compression		0	20	MHz	
		During STARTUP phase		0	50	MHz	
$\Delta F_{CCPAR}$	Variation from the CCLK output frequency set using the BitGen option ConfigRate		Master	-50%	+50%	-	

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in [Table 31](#).
2. RDWR\_B is synchronized to CCLK for the purpose of performing the Abort operation. The same pin asynchronously controls the driver impedance of the D0 - D7 pins. To avoid contention when writing configuration data to the D0 - D7 bus, do not bring RDWR\_B High when CS\_B is Low.
3. In the Slave Parallel mode, it is necessary to use the BUSY pin when the CCLK frequency exceeds this maximum specification.
4. Some Xilinx documents may refer to Parallel modes as "SelectMAP" modes.

Figure 37: JTAG Waveforms

DS099\_06\_040703

Table 67: Timing for the JTAG Test Access Port

Symbol	Description	All Speed Grades		Units	
		Min	Max		
<b>Clock-to-Output Times</b>					
$T_{TCKTDO}$	The time from the falling transition on the TCK pin to data appearing at the TDO pin	1.0	11.0	ns	
<b>Setup Times</b>					
$T_{TDITCK}$	The time from the setup of data at the TDI pin to the rising transition at the TCK pin	7.0	-	ns	
$T_{TMSTCK}$	The time from the setup of a logic level at the TMS pin to the rising transition at the TCK pin	7.0	-	ns	
<b>Hold Times</b>					
$T_{TCKTDI}$	The time from the rising transition at the TCK pin to the point when data is last held at the TDI pin	0	-	ns	
$T_{TCKTMS}$	The time from the rising transition at the TCK pin to the point when a logic level is last held at the TMS pin	0	-	ns	
<b>Clock Timing</b>					
$T_{TCKH}$	TCK pin High pulse width	5	$\infty$	ns	
$T_{TCKL}$	TCK pin Low pulse width	5	$\infty$	ns	
$F_{TCK}$	Frequency of the TCK signal	JTAG Configuration	0	33	MHz
		Boundary-Scan	0	25	MHz

**Notes:**

- The numbers in this table are based on the operating conditions set forth in [Table 31](#).

## Revision History

Date	Version No.	Description
04/11/03	1.0	Initial Xilinx release.
07/11/03	1.1	Extended Absolute Maximum Rating for junction temperature in <a href="#">Table 27</a> . Added numbers for typical quiescent supply current ( <a href="#">Table 33</a> ) and DLL timing.
02/06/04	1.2	Revised $V_{IN}$ maximum rating ( <a href="#">Table 27</a> ). Added power-on requirements ( <a href="#">Table 29</a> ), leakage current number ( <a href="#">Table 32</a> ), and differential output voltage levels ( <a href="#">Table 37</a> ) for Rev. 0. Published new quiescent current numbers ( <a href="#">Table 33</a> ). Updated pull-up and pull-down resistor strengths ( <a href="#">Table 32</a> ). Added LVDCI_DV2 and LVPECL standards ( <a href="#">Table 36</a> and <a href="#">Table 37</a> ). Changed CCLK setup time ( <a href="#">Table 65</a> and <a href="#">Table 66</a> ).
03/04/04	1.3	Added timing numbers from v1.29 speed files as well as DCM timing ( <a href="#">Table 57</a> through <a href="#">Table 62</a> ).
08/24/04	1.4	Added reference to errata documents on <a href="#">page 53</a> . Clarified Absolute Maximum Ratings and added ESD information ( <a href="#">Table 27</a> ). Explained $V_{CCO}$ ramp time measurement ( <a href="#">Table 29</a> ). Clarified $I_L$ specification ( <a href="#">Table 32</a> ). Updated quiescent current numbers and added information on power-on and surplus current ( <a href="#">Table 33</a> ). Adjusted $V_{REF}$ range for HSTL_III and HSTL_I_18 and changed $V_{IH}$ min for LVCMOS12 ( <a href="#">Table 34</a> ). Added note limiting $V_{TT}$ range for SSTL2_II signal standards ( <a href="#">Table 35</a> ). Calculated $V_{OH}$ and $V_{OL}$ levels for differential standards ( <a href="#">Table 37</a> ). Updated Switching Characteristics with speed file v1.32 ( <a href="#">Table 39</a> through <a href="#">Table 47</a> and <a href="#">Table 50</a> through <a href="#">Table 55</a> ). Corrected IOB test conditions ( <a href="#">Table 40</a> ). Updated DCM timing with latest characterization data ( <a href="#">Table 57</a> through <a href="#">Table 61</a> ). Improved DCM CLKIN pulse width specification ( <a href="#">Table 57</a> ). Recommended use of Virtex-II Jitter calculator ( <a href="#">Table 60</a> ). Improved DCM PSCLK pulse width specification ( <a href="#">Table 61</a> ). Changed Phase Shifter lock time parameter ( <a href="#">Table 62</a> ). Because the BitGen option Centered_x#_y# is not necessary for Variable Phase Shift mode, removed BitGen command table and referring text. Adjusted maximum CCLK frequency for the slave serial and parallel configuration modes ( <a href="#">Table 65</a> ). Inverted CCLK waveform ( <a href="#">Figure 35</a> ). Adjusted JTAG setup times ( <a href="#">Table 67</a> ).
12/17/04	1.5	Updated timing parameters to match v1.35 speed file. Improved $V_{CCO}$ ramp time specification ( <a href="#">Table 29</a> ). Added a note limiting the rate of change of $V_{CCAUX}$ ( <a href="#">Table 31</a> ). Added typical quiescent current values for the XC3S2000, XC3S4000, and XC3S5000 ( <a href="#">Table 33</a> ). Increased $I_{OH}$ and $I_{OL}$ for SSTL2-I and SSTL2-II standards ( <a href="#">Table 35</a> ). Added SSO guidelines for the VQ, TQ, and PQ packages as well as edited SSO guidelines for the FT and FG packages ( <a href="#">Table 49</a> ). Added maximum CCLK frequencies for configuration using compressed bitstreams ( <a href="#">Table 65</a> and <a href="#">Table 66</a> ). Added specifications for the HSLVDCI standards ( <a href="#">Table 34</a> , <a href="#">Table 35</a> , <a href="#">Table 43</a> , <a href="#">Table 46</a> , <a href="#">Table 47</a> , and <a href="#">Table 49</a> ).
08/19/05	1.6	Updated timing parameters to match v1.37 speed file. All Spartan-3 part types, except XC3S5000, promoted to Production status. Removed $V_{CCO}$ ramp rate restriction from all mask revision 'E' and later devices ( <a href="#">Table 29</a> ). Added equivalent resistance values for internal pull-up and pull-down resistors ( <a href="#">Table 32</a> ). Added worst-case quiescent current values for XC3S2000, XC3S4000, XC3S5000 ( <a href="#">Table 33</a> ). Added industrial temperature range specification and improved typical quiescent current values ( <a href="#">Table 33</a> ). Improved the DLL minimum clock input frequency specification from 24 MHz down to 18 MHz ( <a href="#">Table 57</a> ). Improved the DFS minimum and maximum clock output frequency specifications ( <a href="#">Table 59</a> , <a href="#">Table 60</a> ). Added new miscellaneous DCM specifications ( <a href="#">Table 63</a> ), primarily affecting Industrial temperature range applications. Updated <b>Simultaneously Switching Output Guidelines</b> and <a href="#">Table 49</a> for QFP packages. Added information on SSTL18_II I/O standard and timing to support DDR2 SDRAM interfaces. Added differential (or complementary single-ended) DIFF_HSTL_II_18 and DIFF_SSTL2_II I/O standards, including DCI terminated versions. Added electro-static discharge (ESD) data for the XC3S2000 and larger FPGAs ( <a href="#">Table 27</a> ). Added link to Spartan-3 errata notices and how to receive automatic notifications of data sheet or errata changes.
04/03/06	2.0	Upgraded Module 3, removing Preliminary status. Moved XC3S5000 to Production status in <a href="#">Table 38</a> . Finalized I/O timing on XC3S5000 for v1.38 speed files. Added minimum timing values for various logic and I/O paths. Corrected labels for $R_{PU}$ and $R_{PD}$ and updated $R_{PD}$ conditions for in <a href="#">Table 32</a> . Added final mask revision 'E' specifications for LVDS_25, RS25_25, LVDSEXT_25 differential outputs to <a href="#">Table 37</a> . Added BLVDS termination requirements to <a href="#">Figure 32</a> . Improved recommended Simultaneous Switching Outputs (SSOs) limits in <a href="#">Table 49</a> for quad-flat packaged based on silicon testing using devices soldered on a printed circuit board. Updated Note 2 in <a href="#">Table 62</a> . Updated Note 6 in <a href="#">Table 29</a> . Added INIT_B minimum pulse width specification, $T_{INIT}$ to <a href="#">Table 64</a> .
04/26/06	2.1	Updated document links.

## The Spartan-3 Generation FPGA Family

DS312, [Spartan-3E FPGA Family](#)

DS314-1, [Spartan-3 XA Automotive FPGA Family](#)

## Introduction

This data sheet module describes the various pins on a Spartan™-3 FPGA and how they connect to the supported component packages.

- The **Pin Types** section categorizes all of the FPGA pins by their function type.
- The **Pin Definitions** section provides a top-level description for each pin on the device.
- The **Detailed, Functional Pin Descriptions** section offers significantly more detail about each pin, especially for the dual- or special-function pins used during device configuration.
- Some pins have associated behavior that is controlled by settings in the configuration bitstream. These options are described in the **Bitstream Options** section.

- The **Package Overview** section describes the various packaging options available for Spartan-3 FPGAs. Detailed pin list tables and footprint diagrams are provided for each package solution.

## Pin Descriptions

### Pin Types

A majority of the pins on a Spartan-3 FPGA are general-purpose, user-defined I/O pins. There are, however, up to 12 different functional types of pins on Spartan-3 packages, as outlined in **Table 68**. In the package footprint drawings that follow, the individual pins are color-coded according to pin type as in the table.

Table 68: Types of Pins on Spartan-3 FPGAs

Type/ Color Code	Description	Pin Name(s) in Type
I/O	Unrestricted, general-purpose user-I/O pin. Most pins can be paired together to form differential I/Os.	IO, IO_Lxxy_#
DUAL	Dual-purpose pin used in some configuration modes during the configuration process and then usually available as a user I/O after configuration. If the pin is not used during configuration, this pin behaves as an I/O-type pin. There are 12 dual-purpose configuration pins on every package. The INIT_B pin has an internal pull-up resistor to VCCO_4 or VCCO_BOTTOM during configuration.	IO_Lxxy_#/DIN/D0, IO_Lxxy_#/D1, IO_Lxxy_#/D2, IO_Lxxy_#/D3, IO_Lxxy_#/D4, IO_Lxxy_#/D5, IO_Lxxy_#/D6, IO_Lxxy_#/D7, IO_Lxxy_#/CS_B, IO_Lxxy_#/RDWR_B, IO_Lxxy_#/BUSY/DOUT, IO_Lxxy_#/INIT_B
CONFIG	Dedicated configuration pin. Not available as a user-I/O pin. Every package has seven dedicated configuration pins. These pins are powered by VCCAUX and have a dedicated internal pull-up resistor to VCCAUX during configuration.	CCLK, DONE, M2, M1, M0, PROG_B, HSWAP_EN
JTAG	Dedicated JTAG pin. Not available as a user-I/O pin. Every package has four dedicated JTAG pins. These pins are powered by VCCAUX and have a dedicated internal pull-up resistor to VCCAUX during configuration.	TDI, TMS, TCK, TDO
DCI	Dual-purpose pin that is either a user-I/O pin or used to calibrate output buffer impedance for a specific bank using Digital Controlled Impedance (DCI). There are two DCI pins per I/O bank.	IO/VRN_# IO_Lxxy_#/VRN_# IO/VRP_# IO_Lxxy_#/VRP_#

Table 68: Types of Pins on Spartan-3 FPGAs (Continued)

Type/ Color Code	Description	Pin Name(s) in Type
VREF	Dual-purpose pin that is either a user-I/O pin or, along with all other VREF pins in the same bank, provides a reference voltage input for certain I/O standards. If used for a reference voltage within a bank, all VREF pins within the bank must be connected.	IO/VREF_# IO_Lxxy_#/VREF_#
GND	Dedicated ground pin. The number of GND pins depends on the package used. All must be connected.	GND
VCCAUX	Dedicated auxiliary power supply pin. The number of VCCAUX pins depends on the package used. All must be connected to +2.5V.	VCCAUX
VCCINT	Dedicated internal core logic power supply pin. The number of VCCINT pins depends on the package used. All must be connected to +1.2V.	VCCINT
VCCO	Dedicated I/O bank, output buffer power supply pin. Along with other VCCO pins in the same bank, this pin supplies power to the output buffers within the I/O bank and sets the input threshold voltage for some I/O standards.	VCCO_# <b>CP132 and TQ144 Packages Only:</b> VCCO_LEFT, VCCO_TOP, VCCO_RIGHT, VCCO_BOTTOM
GCLK	Dual-purpose pin that is either a user-I/O pin or an input to a specific global buffer input. Every package has eight dedicated GCLK pins.	IO_Lxxy_#/GCLK0, IO_Lxxy_#/GCLK1, IO_Lxxy_#/GCLK2, IO_Lxxy_#/GCLK3, IO_Lxxy_#/GCLK4, IO_Lxxy_#/GCLK5, IO_Lxxy_#/GCLK6, IO_Lxxy_#/GCLK7
N.C.	This package pin is not connected in this specific device/package combination but may be connected in larger devices in the same package.	N.C.

**Notes:**

1. # = I/O bank number, an integer between 0 and 7.

I/Os with Lxxy\_# are part of a differential output pair. 'L' indicates differential output capability. The "xx" field is a two-digit integer, unique to each bank that identifies a differential pin-pair. The 'y' field is either 'P' for the true signal or 'N' for the inverted signal in the differential pair. The '#' field is the I/O bank number.

**Pin Definitions**

Table 69 provides a brief description of each pin listed in the Spartan-3 pinout tables and package footprint diagrams. Pins are categorized by their pin type, as listed in Table 68. See **Detailed, Functional Pin Descriptions** for more information.

Table 69: Spartan-3 Pin Definitions

Pin Name	Direction	Description
I/O: General-purpose I/O pins		
I/O	User-defined as input, output, bidirectional, three-state output, open-drain output, open-source output	<b>User I/O:</b> Unrestricted single-ended user-I/O pin. Supports all I/O standards except the differential standards.
IO_Lxxy_#	User-defined as input, output, bidirectional, three-state output, open-drain output, open-source output	<b>User I/O, Half of Differential Pair:</b> Unrestricted single-ended user-I/O pin or half of a differential pair. Supports all I/O standards including the differential standards.
<b>DUAL: Dual-purpose configuration pins</b>		
IO_Lxxy_#/DIN/D0, IO_Lxxy_#/D1, IO_Lxxy_#/D2, IO_Lxxy_#/D3, IO_Lxxy_#/D4, IO_Lxxy_#/D5, IO_Lxxy_#/D6, IO_Lxxy_#/D7	Input during configuration Possible bidirectional I/O after configuration if SelectMap port is retained Otherwise, user I/O after configuration	<b>Configuration Data Port:</b> In Parallel (SelectMAP) modes, D0-D7 are byte-wide configuration data pins. These pins become user I/Os after configuration unless the SelectMAP port is retained via the Persist bitstream option. In Serial modes, DIN (D0) serves as the single configuration data input. This pin becomes a user I/O after configuration unless retained by the Persist bitstream option.
IO_Lxxy_#/CS_B	Input during Parallel mode configuration Possible input after configuration if SelectMap port is retained Otherwise, user I/O after configuration	<b>Chip Select for Parallel Mode Configuration:</b> In Parallel (SelectMAP) modes, this is the active-Low Chip Select signal. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.
IO_Lxxy_#/RDWR_B	Input during Parallel mode configuration Possible input after configuration if SelectMap port is retained Otherwise, user I/O after configuration	<b>Read/Write Control for Parallel Mode Configuration:</b> In Parallel (SelectMAP) modes, this is the active-Low Write Enable, active-High Read Enable signal. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.
IO_Lxxy_#/BUSY/DOUT	Output during configuration Possible output after configuration if SelectMap port is retained Otherwise, user I/O after configuration	<b>Configuration Data Rate Control for Parallel Mode, Serial Data Output for Serial Mode:</b> In Parallel (SelectMAP) modes, BUSY throttles the rate at which configuration data is loaded. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option. In Serial modes, DOUT provides preamble and configuration data to downstream devices in a multi-FPGA daisy-chain. This pin becomes a user I/O after configuration.

Table 69: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
IO_Lxyy_#/INIT_B	Bidirectional (open-drain) during configuration User I/O after configuration	<b>Initializing Configuration Memory/Detected Configuration Error:</b> When Low, this pin indicates that configuration memory is being cleared. When held Low, this pin delays the start of configuration. After this pin is released or configuration memory is cleared, the pin goes High. During configuration, a Low on this output indicates that a configuration data error occurred. This pin always has an internal pull-up resistor to VCCO_4 or VCCO_BOTTOM during configuration, regardless of the HSWAP_EN pin. This pin becomes a user I/O after configuration.
<b>DCI:</b> Digitally Controlled Impedance reference resistor input pins		
IO_Lxyy_#/VRN_# or IO/VRN_#	Input when using DCI Otherwise, same as I/O	<b>DCI Reference Resistor for NMOS I/O Transistor (per bank):</b> If using DCI, a 1% precision impedance-matching resistor is connected between this pin and the VCCO supply for this bank. Otherwise, this pin is a user I/O.
IO_Lxyy_#/VRP_# or IO/VRP_#	Input when using DCI Otherwise, same as I/O	<b>DCI Reference Resistor for PMOS I/O Transistor (per bank):</b> If using DCI, a 1% precision impedance-matching resistor is connected between this pin and the ground supply. Otherwise, this pin is a user I/O.
<b>GCLK:</b> Global clock buffer inputs		
IO_Lxyy_#/GCLK0, IO_Lxyy_#/GCLK1, IO_Lxyy_#/GCLK2, IO_Lxyy_#/GCLK3, IO_Lxyy_#/GCLK4, IO_Lxyy_#/GCLK5, IO_Lxyy_#/GCLK6, IO_Lxyy_#/GCLK7	Input if connected to global clock buffers Otherwise, same as I/O	<b>Global Buffer Input:</b> Direct input to a low-skew global clock buffer. If not connected to a global clock buffer, this pin is a user I/O.
<b>VREF:</b> I/O bank input reference voltage pins		
IO_Lxyy_#/VREF_# or IO/VREF_#	Voltage supply input when VREF pins are used within a bank. Otherwise, same as I/O	<b>Input Buffer Reference Voltage for Special I/O Standards (per bank):</b> If required to support special I/O standards, all the VREF pins within a bank connect to a input threshold voltage source. If not used as input reference voltage pins, these pins are available as individual user-I/O pins.
<b>CONFIG:</b> Dedicated configuration pins (pull-up resistor to VCCAUX always active during configuration, regardless of HSWAP_EN pin)		
CCLK	Input in Slave configuration modes Output in Master configuration modes	<b>Configuration Clock:</b> The configuration clock signal synchronizes configuration data. This pin has an internal pull-up resistor to VCCAUX during configuration.
PROG_B	Input	<b>Program/Configure Device:</b> Active Low asynchronous reset to configuration logic. Asserting PROG_B Low for an extended period delays the configuration process. This pin has an internal pull-up resistor to VCCAUX during configuration.

Table 69: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
DONE	Bidirectional with open-drain or totem-pole Output	<p><b>Configuration Done, Delay Start-up Sequence:</b></p> <p>A Low-to-High output transition on this bidirectional pin signals the end of the configuration process.</p> <p>The FPGA produces a Low-to-High transition on this pin to indicate that the configuration process is complete. The DriveDone bitstream generation option defines whether this pin functions as a totem-pole output that actively drives High or as an open-drain output. An open-drain output requires a pull-up resistor to produce a High logic level. The open-drain option permits the DONE lines of multiple FPGAs to be tied together, so that the common node transitions High only after all of the FPGAs have completed configuration. Externally holding the open-drain output Low delays the start-up sequence, which marks the transition to user mode.</p>
M0, M1, M2	Input	<p><b>Configuration Mode Selection:</b></p> <p>These inputs select the configuration mode. The logic levels applied to the mode pins are sampled on the rising edge of INIT_B. See Table 74. These pins have an internal pull-up resistor to VCCAUX during configuration, making Slave Serial the default configuration mode.</p>
HSWAP_EN	Input	<p><b>Disable Pull-up Resistors During Configuration:</b></p> <p>A Low on this pin enables pull-up resistors on all pins that are not actively involved in the configuration process. A High value disables all pull-ups, allowing the non-configuration pins to float.</p>
<b>JTAG: JTAG interface pins (pull-up resistor to VCCAUX always active during configuration, regardless of HSWAP_EN pin)</b>		
TCK	Input	<p><b>JTAG Test Clock:</b></p> <p>The TCK clock signal synchronizes all JTAG port operations. This pin has an internal pull-up resistor to VCCAUX during configuration.</p>
TDI	Input	<p><b>JTAG Test Data Input:</b></p> <p>TDI is the serial data input for all JTAG instruction and data registers. This pin has an internal pull-up resistor to VCCAUX during configuration.</p>
TMS	Input	<p><b>JTAG Test Mode Select:</b></p> <p>The serial TMS input controls the operation of the JTAG port. This pin has an internal pull-up resistor to VCCAUX during configuration.</p>
TDO	Output	<p><b>JTAG Test Data Output:</b></p> <p>TDO is the serial data output for all JTAG instruction and data registers. This pin has an internal pull-up resistor to VCCAUX during configuration.</p>
<b>VCCO: I/O bank output voltage supply pins</b>		
VCCO_#	Supply	<p><b>Power Supply for Output Buffer Drivers (per bank):</b></p> <p>These pins power the output drivers within a specific I/O bank.</p>

Table 69: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
<b>VCCAUX: Auxiliary voltage supply pins</b>		
VCCAUX	Supply	<b>Power Supply for Auxiliary Circuits:</b> +2.5V power pins for auxiliary circuits, including the Digital Clock Managers (DCMs), the dedicated configuration pins (CONFIG), and the dedicated JTAG pins. All VCCAUX pins must be connected.
<b>VCCINT: Internal core voltage supply pins</b>		
VCCINT	Supply	<b>Power Supply for Internal Core Logic:</b> +1.2V power pins for the internal logic. All pins must be connected.
<b>GND: Ground supply pins</b>		
GND	Supply	<b>Ground:</b> Ground pins, which are connected to the power supply's return path. All pins must be connected.
<b>N.C.: Unconnected package pins</b>		
N.C.		<b>Unconnected Package Pin:</b> These package pins are unconnected.

**Notes:**

- All unused inputs and bidirectional pins must be tied either High or Low. For unused enable inputs, apply the level that disables the associated function. One common approach is to activate internal pull-up or pull-down resistors. An alternative approach is to externally connect the pin to either VCCO or GND.
- All outputs are of the totem-pole type — i.e., they can drive High as well as Low logic levels — except for the cases where “Open Drain” is indicated. The latter can only drive a Low logic level and require a pull-up resistor to produce a High logic level.

## Detailed, Functional Pin Descriptions

### I/O Type: Unrestricted, General-purpose I/O Pins

After configuration, I/O-type pins are inputs, outputs, bidirectional I/O, three-state outputs, open-drain outputs, or open-source outputs, as defined in the application

Pins labeled "IO" support all SelectIO™ signal standards except differential standards. A given device at most only has a few of these pins.

A majority of the general-purpose I/O pins are labeled in the format "IO\_Lxxy\_#". These pins support all SelectIO signal standards, including the differential standards such as LVDS, ULVDS, BLVDS, RSDS, or LDT.

For additional information, see [IOBs, page 11](#)

#### Differential Pair Labeling

A pin supports differential standards if the pin is labeled in the format "Lxxy\_#". The pin name suffix has the following significance. [Figure 38](#) provides a specific example showing a differential input to and a differential output from Bank 2.

- 'L' indicates differential capability.

- "xx" is a two-digit integer, unique for each bank, that identifies a differential pin-pair.
- 'y' is replaced by 'P' for the true signal or 'N' for the inverted. These two pins form one differential pin-pair.
- '#' is an integer, 0 through 7, indicating the associated I/O bank.

If unused, these pins are in a high impedance state. The Bit-stream generator option UnusedPin enables a pull-up or pull-down resistor on all unused I/O pins.

#### Behavior from Power-On through End of Configuration

During the configuration process, all pins that are not actively involved in the configuration process are in a high-impedance state. The CONFIG- and JTAG-type pins have an internal pull-up resistor to VCCAUX during configuration. For all other I/O pins, the HSWAP\_EN input determines whether or not pull-up resistors are activated during configuration. HSWAP\_EN = 0 enables the pull-up resistors. HSWAP\_EN = 1 disables the pull-up resistors allowing the pins to float, which is the desired state for hot-swap applications.

Figure 38: Differential Pair Labelling

### DUAL Type: Dual-Purpose Configuration and I/O Pins

These pins serve dual purposes. The user-I/O pins are temporarily borrowed during the configuration process to load configuration data into the FPGA. After configuration, these pins are then usually available as a user I/O in the application. If a pin is not applicable to the specific configuration mode—controlled by the mode select pins M2, M1, and M0—then the pin behaves as an I/O-type pin.

There are 12 dual-purpose configuration pins on every package, six of which are part of I/O Bank 4, the other six part of I/O Bank 5. Only a few of the pins in Bank 4 are used in the Serial configuration modes.

See “[Pin Behavior During Configuration, page 112](#)”.

### Serial Configuration Modes

This section describes the dual-purpose pins used during either Master or Slave Serial mode. See [Table 74](#) for Mode Select pin settings required for Serial modes. All such pins are in Bank 4 and powered by VCCO\_4.

In both the Master and Slave Serial modes, DIN is the serial configuration data input. The D1-D7 inputs are unused in serial mode and behave like general-purpose I/O pins.

In all the cases, the configuration data is synchronized to the rising edge of the CCLK clock signal.

The DIN, DOUT, and INIT\_B pins can be retained in the application to support reconfiguration by setting the Persist bitstream generation option. However, the serial modes do not support device readback.

Table 70: Dual-Purpose Pins Used in Master or Slave Serial Mode

Pin Name	Direction	Description
DIN	Input	<p><b>Serial Data Input:</b></p> <p>During the Master or Slave Serial configuration modes, DIN is the serial configuration data input, and all data is synchronized to the rising CCLK edge. After configuration, this pin is available as a user I/O.</p> <p>This signal is located in Bank 4 and its output voltage determined by VCCO_4.</p> <p>The BitGen option <i>Persist</i> permits this pin to retain its configuration function in the User mode.</p>
DOUT	Output	<p><b>Serial Data Output:</b></p> <p>In a multi-FPGA design where all the FPGAs use serial mode, connect the DOUT output of one FPGA—in either Master or Slave Serial mode—to the DIN input of the next FPGA—in Slave Serial mode—so that configuration data passes from one to the next, in daisy-chain fashion. This “daisy chain” permits sequential configuration of multiple FPGAs.</p> <p>This signal is located in Bank 4 and its output voltage determined by VCCO_4.</p> <p>The BitGen option <i>Persist</i> permits this pin to retain its configuration function in the User mode.</p>
INIT_B	Bidirectional (open-drain)	<p><b>Initializing Configuration Memory/Configuration Error:</b></p> <p>Just after power is applied, the FPGA produces a Low-to-High transition on this pin indicating that initialization (<i>i.e.</i>, clearing) of the configuration memory has finished. Before entering the User mode, this pin functions as an open-drain output, which requires a pull-up resistor in order to produce a High logic level. In a multi-FPGA design, tie (wire AND) the INIT_B pins from all FPGAs together so that the common node transitions High only after all of the FPGAs have been successfully initialized.</p> <p>Externally holding this pin Low beyond the initialization phase delays the start of configuration. This action stalls the FPGA at the configuration step just before the mode select pins are sampled.</p> <p>During configuration, the FPGA indicates the occurrence of a data (<i>i.e.</i>, CRC) error by asserting INIT_B Low.</p> <p>This signal is located in Bank 4 and its output voltage determined by VCCO_4.</p> <p>The BitGen option <i>Persist</i> permits this pin to retain its configuration function in the User mode.</p>

Figure 39: Configuration Data Byte Mapping to D0-D7 Bits

### Parallel Configuration Modes (SelectMAP)

This section describes the dual-purpose configuration pins used during the Master and Slave Parallel configuration modes, sometimes also called the SelectMAP modes. In both Master and Slave Parallel configuration modes, D0-D7 form the byte-wide configuration data input. See [Table 74](#) for Mode Select pin settings required for Parallel modes.

As shown in [Figure 39](#), D0 is the most-significant bit while D7 is the least-significant bit. Bits D0-D3 form the high nibble of the byte and bits D4-D7 form the low nibble.

In the Parallel configuration modes, both the VCCO\_4 and VCCO\_5 voltage supplies are required and must both equal the voltage of the attached configuration device, typically either 2.5V or 3.3V.

Assert Low both the chip-select pin, CS\_B, and the read/write control pin, RDWR\_B, to write the configuration data byte presented on the D0-D7 pins to the FPGA on a rising-edge of the configuration clock, CCLK. The order of CS\_B and RDWR\_B does not matter, although RDWR\_B must be asserted throughout the configuration process. If RDWR\_B is de-asserted during configuration, the FPGA aborts the configuration operation.

After configuration, these pins are available as general-purpose user I/O. However, the SelectMAP configuration interface is optionally available for debugging and dynamic

reconfiguration. To use these SelectMAP pins after configuration, set the Persist bitstream generation option.

The Readback debugging option, for example, requires the Persist bitstream generation option. During Readback mode, assert CS\_B Low, along with RDWR\_B High, to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge. During Readback mode, D0-D7 are output pins.

In all the cases, the configuration data and control signals are synchronized to the rising edge of the CCLK clock signal.

Table 71: Dual-Purpose Configuration Pins for Parallel (SelectMAP) Configuration Modes

Pin Name	Direction	Description						
D0, D1, D2, D3	Input during configuration Output during readback	<p><b>Configuration Data Port (high nibble):</b> Collectively, the D0-D7 pins are the byte-wide configuration data port for the Parallel (SelectMAP) configuration modes. Configuration data is synchronized to the rising edge of CCLK clock signal. The D0-D3 pins are the high nibble of the configuration data byte and located in Bank 4 and powered by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p>						
D4, D5, D6, D7	Input during configuration Output during readback	<p><b>Configuration Data Port (low nibble):</b> The D4-D7 pins are the low nibble of the configuration data byte. However, these signals are located in Bank 5 and powered by VCCO_5. The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p>						
CS_B	Input	<p><b>Chip Select for Parallel Mode Configuration:</b> Assert this pin Low, together with RDWR_B to write a configuration data byte from the D0-D7 bus to the FPGA on a rising CCLK edge. During Readback, assert this pin Low, along with RDWR_B High, to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge. This signal is located in Bank 5 and powered by VCCO_5. The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p> <table border="1"> <thead> <tr> <th>CS_B</th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>FPGA selected. ### JTAG Configuration Mode

In the JTAG configuration mode all dual-purpose configuration pins are unused and behave exactly like user-I/O pins, as shown in [Table 78](#). See [Table 74](#) for Mode Select pin settings required for JTAG mode.

### Dual-Purpose Pin I/O Standard During Configuration

During configuration, the dual-purpose pins default to CMOS input and output levels for the associated VCCO voltage supply pins. For example, in the Parallel configuration modes, both VCCO\_4 and VCCO\_5 are required. If connected to +2.5V, then the associated pins conform to the

LVC MOS25 I/O standard. If connected to +3.3V, then the pins drive LVCMOS output levels and accept either LVTTTL or LVCMOS input levels.

### Dual-Purpose Pin Behavior After Configuration

After the configuration process completes, these pins, if they were borrowed during configuration, become user-I/O pins available to the application. If a dual-purpose configuration pin is not used during the configuration process—*i.e.*, the parallel configuration pins when using serial mode—then the pin behaves exactly like a general-purpose I/O. See [I/O Type: Unrestricted, General-purpose I/O Pins](#) section above.

Figure 40: DCI Termination Types

### DCI: User I/O or Digitally Controlled Impedance Resistor Reference Input

These pins are individual user-I/O pins unless one of the I/O standards used in the bank requires the Digitally Controlled Impedance (DCI) feature. If DCI is used, then 1% precision resistors connected to the VRP\_# and VRN\_# pins match the impedance on the input or output buffers of the I/O standards that use DCI within the bank.

The '#' character in the pin name indicates the associated I/O bank and is an integer, 0 through 7.

There are two DCI pins per I/O bank, except in the CP132 and TQ144 packages, which do not have any DCI inputs for Bank 5.

#### VRP and VRN Impedance Resistor Reference Inputs

The 1% precision impedance-matching resistor attached to the VRP\_# pin controls the pull-up impedance of PMOS transistor in the input or output buffer. Consequently, the VRP\_# pin must connect to ground. The 'P' character in "VRP" indicates that this pin controls the I/O buffer's PMOS transistor impedance. The VRP\_# pin is used for both single and split termination.

The 1% precision impedance-matching resistor attached to the VRN\_# pin controls the pull-down impedance of NMOS transistor in the input or output buffer. Consequently, the VRN\_# pin must connect to VCCO. The 'N' character in "VRN" indicates that this pin controls the I/O buffer's NMOS transistor impedance. The VRN\_# pin is only used for split termination.

Each VRN or VRP reference input requires its own resistor. A single resistor cannot be shared between VRN or VRP pins associated with different banks.

During configuration, these pins behave exactly like user-I/O pins. The associated DCI behavior is not active or valid until after configuration completes.

Also see [Digitally Controlled Impedance \(DCI\)](#), page 15.

#### DCI Termination Types

If the I/O in an I/O bank do not use the DCI feature, then no external resistors are required and both the VRP\_# and VRN\_# pins are available for user I/O, as shown in [Figure 40a](#).

If the I/O standards within the associated I/O bank require single termination—such as GTL\_DCI, GTLP\_DCI, or HSTL\_III\_DCI—then only the VRP\_# signal connects to a 1% precision impedance-matching resistor, as shown in [Figure 40b](#). A resistor is not required for the VRN\_# pin.

Finally, if the I/O standards with the associated I/O bank require split termination—such as HSTL\_I\_DCI, SSTL2\_I\_DCI, SSTL2\_II\_DCI, or LVDS\_25\_DCI and LVDSEXT\_25\_DCI receivers—then both the VRP\_# and VRN\_# pins connect to separate 1% precision impedance-matching resistors, as shown in [Figure 40c](#). Neither pin is available for user I/O.

### GCLK: Global Clock Buffer Inputs or General-Purpose I/O Pins

These pins are user-I/O pins unless they specifically connect to one of the eight low-skew global clock buffers on the device, specified using the IBUG primitive.

There are eight GCLK pins per device and two each appear in the top-edge banks, Bank 0 and 1, and the bottom-edge banks, Banks 4 and 5. See [Figure 38](#) for a picture of bank labeling.

During configuration, these pins behave exactly like user-I/O pins.

Also see [Global Clock Network](#), page 39.

### CONFIG: Dedicated Configuration Pins

The dedicated configuration pins control the configuration process and are not available as user-I/O pins. Every package has seven dedicated configuration pins. All CONFIG-type pins are powered by the +2.5V VCCAUX supply.

Also see [Configuration](#), page 43.

### CCLK: Configuration Clock

The configuration clock signal on this pin synchronizes the reading or writing of configuration data. The CCLK pin is an input-only pin for the Slave Serial and Slave Parallel configuration modes. In the Master Serial and Master Parallel configuration modes, the FPGA drives the CCLK pin and CCLK should be treated as a full bidirectional I/O pin for signal integrity analysis.

Although the CCLK frequency is relatively low, Spartan-3 FPGA output edge rates are fast. Any potential signal integrity problems on the CCLK board trace can cause FPGA configuration to fail. Therefore, pay careful attention to the CCLK signal integrity on the printed circuit board. Signal integrity simulation with IBIS is recommended. For all configuration modes except JTAG, consider the signal integrity at every CCLK trace destination, including the FPGA's CCLK pin.

During configuration, the CCLK pin has a pull-up resistor to VCCAUX, regardless of the HSWAP\_EN pin. After configuration, the CCLK pin is pulled High to VCCAUX by default as defined by the **CclkPin** bitstream selection, although this behavior is programmable. Any clocks applied to CCLK after configuration are ignored unless the bitstream option **Persist** is set to **Yes**, which retains the configuration interface. **Persist** is set to **No** by default. However, if **Persist** is set to **Yes**, then all clock edges are potentially active events, depending on the other configuration control signals.

The bitstream generator option **ConfigRate** determines the frequency of the internally-generated CCLK oscillator required for the Master configuration modes. The actual frequency is approximate due to the characteristics of the silicon oscillator and varies by up to 50% over the temperature and voltage range. By default, CCLK operates at approximately 6 MHz. Via the **ConfigRate** option, the oscillator frequency is set at approximately 3, 6, 12, 25, or 50 MHz. At power-on, CCLK always starts operation at its lowest frequency. The device does not start operating at the higher frequency until the ConfigRate control bits are loaded during the configuration process.

### PROG\_B: Program/Configure Device

This asynchronous pin initiates the configuration or re-configuration processes. A Low-going pulse resets the configuration logic, initializing the configuration memory. This initialization process cannot finish until PROG\_B returns High. Asserting PROG\_B Low for an extended period delays the configuration process. At power-up, there is always a pull-up resistor to VCCAUX on this pin, regardless of the HSWAP\_EN input. After configuration, the bitstream generator option **ProgPin** determines whether or not the pull-up resistor is present. By default, the **ProgPin** option retains the pull-up resistor.

After configuration, hold the PROG\_B input High. Any Low-going pulse on PROG\_B, lasting 300 ns or longer, restarts the configuration process.

Table 72: PROG\_B Operation

PROG_B Input	Response
<b>Power-up</b>	Automatically initiates configuration process.
<b>Low-going pulse</b> 	Initiate (re-)configuration process and continue to completion.
<b>Extended Low</b> 	Initiate (re-)configuration process and stall process at step where configuration memory is cleared. Process is stalled until PROG_B returns High.
<b>1</b>	If the configuration process is started, continue to completion. If configuration process is complete, stay in User mode.

### DONE: Configuration Done, Delay Start-Up Sequence

The FPGA produces a Low-to-High transition on this pin indicating that the configuration process is complete. The bitstream generator option **DriveDone** determines whether this pin functions as a totem-pole output that can drive High or as an open-drain output. If configured as an open-drain output—which is the default behavior—then a pull-up resistor is required to produce a High logic level. There is a bitstream option that provides an internal pull-up resistor, otherwise an external pull-up resistor is required.

The open-drain option permits the DONE lines of multiple FPGAs to be tied together, so that the common node transitions High only after all of the FPGAs have completed configuration. Externally holding the open-drain DONE pin Low delays the start-up sequence, which marks the transition to user mode.

Once the FPGA enters User mode after completing configuration, the DONE pin no longer drives the DONE pin Low. The bitstream generator option **DonePin** determines whether or not a pull-up resistor is present on the DONE pin to pull the pin to VCCAUX. If the pull-up resistor is eliminated, then the DONE pin must be pulled High using an external pull-up resistor or one of the FPGAs in the design must actively drive the DONE pin High via the **DriveDone** bitstream generator option.

The bitstream generator option **DriveDone** causes the FPGA to actively drive the DONE output High after configuration. This option should only be used in single-FPGA designs or on the last FPGA in a multi-FPGA daisy-chain.

By default, the bitstream generator software retains the pull-up resistor and does not actively drive the DONE pin as highlighted in Table 73. Table 73 shows the interaction of these bitstream options in single- and multi-FPGA designs.

Table 73: DonePin and DriveDone Bitstream Option Interaction

DonePin	DriveDone	Single- or Multi-FPGA Design	Comments
Pullnone	No	Single	External pull-up resistor, with value between 330W to 3.3kW, required on DONE.
Pullnone	No	Multi	External pull-up resistor, with value between 330W to 3.3kW, required on common node connecting to all DONE pins.
Pullnone	Yes	Single	OK, no external requirements.
Pullnone	Yes	Multi	DriveDone on last device in daisy-chain only. No external requirements.
Pullup	No	Single	OK, but pull-up on DONE pin has slow rise time. May require 330 W pull-up resistor for high CCLK frequencies.
Pullup	No	Multi	External pull-up resistor, with value between 330W to 3.3kW, required on common node connecting to all DONE pins.
Pullup	Yes	Single	OK, no external requirements.
Pullup	Yes	Multi	DriveDone on last device in daisy-chain only. No external requirements.

**M2, M1, M0: Configuration Mode Selection**

The M2, M1, and M0 inputs select the FPGA configuration mode, as described in Table 74. The logic levels applied to the mode pins are sampled on the rising edge of INIT\_B.

Table 74: Spartan-3 Mode Select Settings

Configuration Mode	M2	M1	M0
Master Serial	0	0	0
Slave Serial	1	1	1
Master Parallel	0	1	1
Slave Parallel	1	1	0
JTAG	1	0	1
Reserved	0	0	1
Reserved	0	1	0
Reserved	1	0	0
After Configuration	X	X	X

**Notes:**

- 1. X = don't care, either 0 or 1.

Before and during configuration, the mode pins have an internal pull-up resistor to VCCAUX, regardless of the HSWAP\_EN pin. If the mode pins are unconnected, then the FPGA defaults to the Slave Serial configuration mode. After configuration successfully completes, any levels applied to these input are ignored. Furthermore, the bitstream generator options **MOPin**, **M1Pin**, and **M2Pin** determines whether a pull-up resistor, pull-down resistor, or no resistor is present on its respective mode pin, M0, M1, or M2.

**HSWAP\_EN: Disable Pull-up Resistors During Configuration**

As shown in Table 75, a Low on this asynchronous pin enables pull-up resistors on all user I/Os not actively involved in the

configuration process, although only until device configuration completes. A High disables the pull-up resistors during configuration, which is the desired state for some applications.

The dedicated configuration CONFIG pins (CCLK, DONE, PROG\_B, HSWAP\_EN, M2, M1, M0), the JTAG pins (TDI, TMS, TCK, TDO) and the INIT\_B always have active pull-up resistors during configuration, regardless of the value on HSWAP\_EN.

After configuration, HSWAP\_EN becomes a "don't care" input and any pull-up resistors previously enabled by HSWAP\_EN are disabled. If a user I/O in the application requires a pull-up resistor after configuration, place a PULLUP primitive on the associated I/O pin or, for some pins, set the associated bitstream generator option.

Table 75: HSWAP\_EN Encoding

HSWAP_EN	Function
<b>During Configuration</b>	
0	Enable pull-up resistors on all pins not actively involved in the configuration process. Pull-ups are only active until configuration completes. See Table 78.
1	No pull-up resistors during configuration.
<b>After Configuration, User Mode</b>	
X	This pin has no function except during device configuration.

**Notes:**

- 1. X = don't care, either 0 or 1.

The Bitstream generator option **HswapenPin** determines whether a pull-up resistor to VCCAUX, a pull-down resistor, or no resistor is present on HSWAP\_EN after configuration.

Table 76: JTAG Pin Descriptions

Pin Name	Direction	Description	Bitstream Generation Option
TCK	Input	<b>Test Clock:</b> The TCK clock signal synchronizes all boundary scan operations on its rising edge.	The BitGen option <i>TckPin</i> determines whether a pull-up resistor, pull-down resistor or no resistor is present.
TDI	Input	<b>Test Data Input:</b> TDI is the serial data input for all JTAG instruction and data registers. This input is sampled on the rising edge of TCK.	The BitGen option <i>TdiPin</i> determines whether a pull-up resistor, pull-down resistor or no resistor is present.
TMS	Input	<b>Test Mode Select:</b> The TMS input controls the sequence of states through which the JTAG TAP state machine passes. This input is sampled on the rising edge of TCK.	The BitGen option <i>TmsPin</i> determines whether a pull-up resistor, pull-down resistor or no resistor is present.
TDO	Output	<b>Test Data Output:</b> The TDO pin is the data output for all JTAG instruction and data registers. This output is sampled on the rising edge of TCK. The TDO output is an active totem-pole driver and is not like the open-collector TDO output on Virtex™-II Pro FPGAs.	The BitGen option <i>TdoPin</i> determines whether a pull-up resistor, pull-down resistor or no resistor is present.

## JTAG: Dedicated JTAG Port Pins

These pins are dedicated connections to the four-wire IEEE 1532/IEEE 1149.1 JTAG port, shown in Figure 41 and described in Table 76. The JTAG port is used for boundary-scan testing, device configuration, application debugging, and possibly an additional serial port for the application. These pins are dedicated and are not available as user-I/O pins. Every package has four dedicated JTAG pins and these pins are powered by the +2.5V VCCAUX supply.

For additional information on JTAG configuration, see **Boundary-Scan (JTAG) Mode**, page 47.

Figure 41: JTAG Port

## IDCODE Register

Spartan-3 FPGAs contain a 32-bit identification register called the IDCODE register, as defined in the IEEE 1149.1 JTAG standard. The fixed value electrically identifies the manufacture (Xilinx) and the type of device being addressed over a JTAG chain. This register allows the JTAG host to identify the device being tested or programmed via JTAG.

Table 77: Spartan-3 JTAG IDCODE Register Values (hexadecimal)

Part Number	IDCODE Register
XC3S50	0x0140C093
XC3S200	0x01414093
XC3S400	0x0141C093
XC3S1000	0x01428093
XC3S1500	0x01434093
XC3S2000	0x01440093
XC3S4000	0x01448093
XC3S5000	0x01450093

## Using JTAG Port After Configuration

The JTAG port is always active and available before, during, and after FPGA configuration. Add the BSCAN\_SPARTAN3 primitive to the design to create user-defined JTAG instructions and JTAG chains to communicate with internal logic.

Furthermore, the contents of the User ID register within the JTAG port can be specified as a Bitstream Generation option. By default, the 32-bit User ID register contains 0xFFFFFFFF.

## Precautions When Using the JTAG Port in 3.3V Environments

The JTAG port is powered by the +2.5V VCCAUX power supply. When connecting to a 3.3V interface, the JTAG input pins must be current-limited using a series resistor. Similarly, the TDO pin is a CMOS output powered from +2.5V.

The TDO output can directly drive a 3.3V input but with reduced noise immunity. See [3.3V-Tolerant Configuration Interface, page 44](#) or [XAPP453: The 3.3V Configuration of Spartan-3 FPGAs](#) for additional details.

The following interface precautions are recommended when connecting the JTAG port to a 3.3V interface.

1. Avoid actively driving the JTAG input signals High with 3.3V signal levels. If required in the application, use series current-limiting resistors to keep the current below 10 mA per pin.
2. If possible, drive the FPGA JTAG inputs with drivers that can be placed in high-impedance (Hi-Z) after using the JTAG port. Alternatively, drive the FPGA JTAG inputs with open-drain outputs, which only drive Low. In both cases, pull-up resistors are required. The FPGA JTAG pins have pull-up resistors to VCCAUX before configuration and optional pull-up resistors after configuration, controlled by [Bitstream Options, page 115](#).

### VREF: User I/O or Input Buffer Reference Voltage for Special Interface Standards

These pins are individual user-I/O pins unless collectively they supply an input reference voltage, VREF\_#, for any SSTL, HSTL, GTL, or GTLP I/Os implemented in the associated I/O bank.

The '#' character in the pin name represents an integer, 0 through 7, that indicates the associated I/O bank.

The VREF function becomes active for this pin whenever a signal standard requiring a reference voltage is used in the associated bank.

If used as a user I/O, then each pin behaves as an independent I/O described in the I/O type section. If used for a reference voltage within a bank, then *all* VREF pins within the bank must be connected to the same reference voltage.

Spartan-3 devices are designed and characterized to support certain I/O standards when VREF is connected to +1.25V, +1.10V, +1.00V, +0.90V, +0.80V, and +0.75V.

During configuration, the VREF pins behave exactly like user-I/O pins.

If designing for footprint compatibility across the range of devices in a specific package, and if the VREF\_# pins within a bank connect to an input reference voltage, then also connect any N.C. (not connected) pins on the smaller devices in that package to the input reference voltage. More details are provided later for each package type.

### N.C. Type: Unconnected Package Pins

Pins marked as "N.C." are unconnected for the specific device/package combination. For other devices in this same package, this pin may be used as an I/O or VREF connec-

tion. In both the pinout tables and the footprint diagrams, unconnected pins are noted with either a black diamond symbol (◆) or a black square symbol (■).

If designing for footprint compatibility across multiple device densities, check the pin types of the other Spartan-3 devices available in the same footprint. If the N.C. pin matches to VREF pins in other devices, and the VREF pins are used in the associated I/O bank, then connect the N.C. to the VREF voltage source.

### VCCO Type: Output Voltage Supply for I/O Bank

Each I/O bank has its own set of voltage supply pins that determines the output voltage for the output buffers in the I/O bank. Furthermore, for some I/O standards such as LVCMOS, LVCMOS25, LVTTTL, etc., VCCO sets the input threshold voltage on the associated input buffers.

Spartan-3 devices are designed and characterized to support various I/O standards for VCCO values of +1.2V, +1.5V, +1.8V, +2.5V, and +3.3V.

Most VCCO pins are labeled as VCCO\_# where the '#' symbol represents the associated I/O bank number, an integer ranging from 0 to 7. In the 144-pin TQFP package (TQ144) however, the VCCO pins along an edge of the device are combined into a single VCCO input. For example, the VCCO inputs for Bank 0 and Bank 1 along the top edge of the package are combined and relabeled VCCO\_TOP. The bottom, left, and right edges are similarly combined.

In Serial configuration mode, VCCO\_4 must be at a level compatible with the attached configuration memory or data source. In Parallel configuration mode, both VCCO\_4 and VCCO\_5 must be at the same compatible voltage level.

All VCCO inputs to a bank must be connected together and to the voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

### VCCINT Type: Voltage Supply for Internal Core Logic

Internal core logic circuits such as the configurable logic blocks (CLBs) and programmable interconnect operate from the VCCINT voltage supply inputs. VCCINT must be +1.2V.

All VCCINT inputs must be connected together and to the +1.2V voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

## VCCAUX Type: Voltage Supply for Auxiliary Logic

The VCCAUX pins supply power to various auxiliary circuits, such as to the Digital Clock Managers (DCMs), the JTAG pins, and to the dedicated configuration pins (CONFIG type). VCCAUX must be +2.5V.

All VCCAUX inputs must be connected together and to the +2.5V voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

Because VCCAUX connects to the DCMs and the DCMs are sensitive to voltage changes, be sure that the VCCAUX supply and the ground return paths are designed for low noise and low voltage drop, especially that caused by a large number of simultaneous switching I/Os.

## GND Type: Ground

All GND pins must be connected and have a low resistance path back to the various VCCO, VCCINT, and VCCAUX supplies.

## Pin Behavior During Configuration

Table 78 shows how various pins behave during the FPGA configuration process. The actual behavior depends on the values applied to the M2, M1, and M0 mode select pins and the HSWAP\_EN pin. The mode select pins determine which of the DUAL type pins are active during configuration. In

JTAG configuration mode, none of the DUAL-type pins are used for configuration and all behave as user-I/O pins.

All DUAL-type pins not actively used during configuration and all I/O-type, DCI-type, VREF-type, GCLK-type pins are high impedance (floating, three-stated, Hi-Z) during the configuration process. These pins are indicated in Table 78 as shaded table entries or cells. These pins have a pull-up resistor to their associated VCCO if the HSWAP\_EN pin is Low. When HSWAP\_EN is High, these pull-up resistors are disabled during configuration.

Some pins always have an active pull-up resistor during configuration, regardless of the value applied to the HSWAP\_EN pin. After configuration, these pull-up resistors are controlled by **Bitstream Options**.

- All the dedicated CONFIG-type configuration pins (CCLK, PROG\_B, DONE, M2, M1, M0, and HSWAP\_EN) have a pull-up resistor to VCCAUX.
- All JTAG-type pins (TCK, TDI, TMS, TDO) have a pull-up resistor to VCCAUX.
- The INIT\_B DUAL-purpose pin has a pull-up resistor to VCCO\_4 or VCCO\_BOTTOM, depending on package style.

After configuration completes, some pins have optional behavior controlled by the configuration bitstream loaded into the part. For example, via the bitstream, all unused I/O pins can be collectively configured as input pins with either a pull-up resistor, a pull-down resistor, or be left in a high-impedance state.

Table 78: Pin Behavior After Power-Up, During Configuration

Pin Name	Configuration Mode Settings <M2:M1:M0>					Bitstream Configuration Option

<b>GND: Ground supply pins</b>						
GND	GND	GND	GND	GND	GND	

**Notes:**

- #= I/O bank number, an integer from 0 to 7.
- (I) = input, (O) = output, (OD) = open-drain output, (I/O) = bidirectional, (I/OD) = bidirectional with open-drain output. Open-drain output requires pull-up to create logic High level.
-  Shaded cell indicates that the pin is high-impedance during configuration. To enable a soft pull-up resistor during configuration, drive or tie HSWAP\_EN Low.

## Bitstream Options

Table 79 lists the various bitstream options that affect pins on a Spartan-3 FPGA. The table shows the names of the affected pins, describes the function of the bitstream option, *Table 79: Bitstream Options Affecting Spartan-3 Pins*

the name of the bitstream generator option variable, and the legal values for each variable. The default option setting for each variable is indicated with bold, underlined text.

Affected Pin Name(s)	Bitstream Generation Function	Option Variable Name	Values (default value)
All unused I/O pins of type I/O, DUAL, GCLK, DCI, VREF	For all I/O pins that are unused in the application after configuration, this option defines whether the I/Os are individually tied to VCCO via a pull-up resistor, tied ground via a pull-down resistor, or left floating. If left floating, the unused pins should be connected to a defined logic level, either from a source internal to the FPGA or external.	UnusedPin	<ul style="list-style-type: none"> <li><b><u>Pulldown</u></b></li> <li>Pullup</li> <li>Pullnone</li> </ul>
IO_Lxxy_#/DIN, IO_Lxxy_#/DOUT, IO_Lxxy_#/INIT_B	Serial configuration mode: If set to Yes, then these pins retain their functionality after configuration completes, allowing for device (re-)configuration. Readback is not supported in with serial mode.	Persist	<ul style="list-style-type: none"> <li><b>No</b></li> <li>Yes</li> </ul>
IO_Lxxy_#/D0, IO_Lxxy_#/D1, IO_Lxxy_#/D2, IO_Lxxy_#/D3, IO_Lxxy_#/D4, IO_Lxxy_#/D5, IO_Lxxy_#/D6, IO_Lxxy_#/D7, IO_Lxxy_#/CS_B, IO_Lxxy_#/RDWR_B, IO_Lxxy_#/BUSY, IO_Lxxy_#/INIT_B	Parallel configuration mode (also called SelectMAP): If set to Yes, then these pins retain their SelectMAP functionality after configuration completes, allowing for device readback and for partial or complete (re-)configuration.	Persist	<ul style="list-style-type: none"> <li><b>No</b></li> <li>Yes</li> </ul>
CCLK	After configuration, this bitstream option either pulls CCLK to VCCAUX via a pull-up resistor, or allows CCLK to float.	CclkPin	<ul style="list-style-type: none"> <li><b><u>Pullup</u></b></li> <li>Pullnone</li> </ul>
CCLK	For Master configuration modes, this option sets the approximate frequency, in MHz, for the internal silicon oscillator.	ConfigRate	3, <b><u>6</u></b> , 12, 25, 50
PROG_B	A pull-up resistor to VCCAUX exists on PROG_B during configuration. After configuration, this bitstream option either pulls DONE to VCCAUX via a pull-up resistor, or allows DONE to float.	ProgPin	<ul style="list-style-type: none"> <li><b><u>Pullup</u></b></li> <li>Pullnone</li> </ul>
DONE	After configuration, this bitstream option either pulls DONE to VCCAUX via a pull-up resistor, or allows DONE to float. See also DriveDone option.	DonePin	<ul style="list-style-type: none"> <li><b><u>Pullup</u></b></li> <li>Pullnone</li> </ul>
DONE	If set to Yes, this option allows the FPGA's DONE pin to drive High when configuration completes. By default, the DONE is an open-drain output and can only drive Low. Only single FPGAs and the last FPGA in a multi-FPGA daisy-chain should use this option.	DriveDone	<ul style="list-style-type: none"> <li><b>No</b></li> <li>Yes</li> </ul>
M2	After configuration, this bitstream option either pulls M2 to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows M2 to float.	M2Pin	<ul style="list-style-type: none"> <li><b><u>Pullup</u></b></li> <li>Pulldown</li> <li>Pullnone</li> </ul>
M1	After configuration, this bitstream option either pulls M1 to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows M1 to float.	M1Pin	<ul style="list-style-type: none"> <li><b><u>Pullup</u></b></li> <li>Pulldown</li> <li>Pullnone</li> </ul>

Table 79: Bitstream Options Affecting Spartan-3 Pins (Continued)

Affected Pin Name(s)	Bitstream Generation Function	Option Variable Name	Values (default value)
M0	After configuration, this bitstream option either pulls M0 to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows M0 to float.	M0Pin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pulldown</li> <li>• Pullnone</li> </ul>
HSWAP_EN	After configuration, this bitstream option either pulls HSWAP_EN to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows HSWAP_EN to float.	HswapenPin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pulldown</li> <li>• Pullnone</li> </ul>
TDI	After configuration, this bitstream option either pulls TDI to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows TDI to float.	TdiPin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pulldown</li> <li>• Pullnone</li> </ul>
TMS	After configuration, this bitstream option either pulls TMS to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows TMS to float.	TmsPin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pulldown</li> <li>• Pullnone</li> </ul>
TCK	After configuration, this bitstream option either pulls TCK to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows TCK to float.	TckPin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pulldown</li> <li>• Pullnone</li> </ul>
TDO	After configuration, this bitstream option either pulls TDO to VCCAUX via a pull-up resistor, to ground via a pull-down resistor, or allows TDO to float.	TdoPin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pulldown</li> <li>• Pullnone</li> </ul>

## Setting Bitstream Generator Options

Refer to the [“BitGen” chapter](#) in the Xilinx ISE software documentation.

## Package Overview

Table 80 shows the 10 low-cost, space-saving production package styles for the Spartan-3 family. Each package style is available as a standard and an environmentally-friendly lead-free (Pb-free) option. The Pb-free packages include an

extra ‘G’ in the package style name. For example, the standard “VQ100” package becomes “VQG100” when ordered as the Pb-free option. The mechanical dimensions of the standard and Pb-free packages are similar, as shown in the mechanical drawings provided in Table 82.

Not all Spartan-3 densities are available in all packages. However, for a specific package there is a common footprint for that supports the various devices available in that package. See the footprint diagrams that follow.

Table 80: Spartan-3 Family Package Options

Package	Leads	Type	Maximum I/O	Pitch (mm)	Area (mm)	Height (mm)
VQ100 / VQG100	100	Very-thin Quad Flat Pack	63	0.5	16 x 16	1.20
CP132 / CPG132	132	Chip-Scale Package	89	0.5	8 x 8	1.10
TQ144 / TQG144	144	Thin Quad Flat Pack	97	0.5	22 x 22	1.60
PQ208 / PQG208	208	Quad Flat Pack	141	0.5	30.6 x 30.6	4.10
FT256 / FTG256	256	Fine-pitch, Thin Ball Grid Array	173	1.0	17 x 17	1.55
FG320 / FGG320	320	Fine-pitch Ball Grid Array	221	1.0	19 x 19	2.00
FG456 / FGG456	456	Fine-pitch Ball Grid Array	333	1.0	23 x 23	2.60
FG676 / FGG676	676	Fine-pitch Ball Grid Array	489	1.0	27 x 27	2.60
FG900 / FGG900	900	Fine-pitch Ball Grid Array	633	1.0	31 x 31	2.60
FG1156 / FGG1156	1156	Fine-pitch Ball Grid Array	784	1.0	35 x 35	2.60

## Selecting the Right Package Option

Spartan-3 FPGAs are available in both quad-flat pack (QFP) and ball grid array (BGA) packaging options. While QFP packaging offers the lowest absolute cost, the BGA

packages are superior in almost every other aspect, as summarized in [Table 81](#). Consequently, Xilinx recommends using BGA packaging whenever possible.

*Table 81: Comparing Spartan-3 Packaging Options*

Characteristic	Quad Flat-Pack (QFP)	Ball Grid Array (BGA)
Maximum User I/O	141	784
Packing Density (Logic/Area)	Good	Better
Signal Integrity	Fair	Better
Simultaneous Switching Output (SSO) Support	Limited	Better
Thermal Dissipation	Fair	Better
Minimum Printed Circuit Board (PCB) Layers	4	6
Hand Assembly/Rework	Possible	Very Difficult

## Mechanical Drawings

Detailed mechanical drawings for each package type are available from the Xilinx website at the specified location in [Table 82](#).

## Power, Ground, and I/O by Package

Each package has three separate voltage supply inputs—VCCINT, VCCAUX, and VCCO—and a common ground return, GND. The numbers of pins dedicated to these functions varies by package, as shown in [Table 83](#).

**Table 83: Power and Ground Supply Pins by Package**

Package	VCCINT	VCCAUX	VCCO	GND
VQ100	4	4	8	10
CP132	4	4	12	12
TQ144	4	4	12	16
PQ208	4	8	12	28
FT256	8	8	24	32
FG320	12	8	28	40
FG456	12	8	40	52
FG676	20	16	64	76
FG900	32	24	80	120
FG1156	40	32	104	184

A majority of package pins are user-defined I/O pins. However, the numbers and characteristics of these I/O depends on the device type and the package in which it is available, as shown in [Table 84](#). The table shows the maximum number of single-ended I/O pins available, assuming that all I/O-, DUAL-, DCI-, VREF-, and GCLK-type pins are used as general-purpose I/O. Likewise, the table shows the maximum number of differential pin-pairs available on the package. Finally, the table shows how the total maximum user I/Os are distributed by pin type, including the number of unconnected—i.e., N.C.—pins on the device.

Table 84: Maximum User I/Os by Package

Device	Package	Maximum User I/Os	Maximum Differential Pairs	All Possible I/O Pins by Type					N.C.

Electronic versions of the package pinout tables and footprints are available for download from the Xilinx website. Using a spreadsheet program, the data can be sorted and reformatted according to any specific needs. Similarly, the

ASCII-text file is easily parsed by most scripting programs. Download the files from the following location:

[http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip)

## Package Thermal Characteristics

The power dissipated by an FPGA application has implications on package selection and system design. The power consumed by a Spartan-3 FPGA is reported using either the [Web Power Tool](#) estimator or the [XPower](#) calculator integrated in the Xilinx ISE development software. [Table 85](#) provides the thermal characteristics for the various Spartan-3 package offerings.

The junction-to-case thermal resistance ( $\theta_{JC}$ ) indicates the difference between the temperature measured on the pack-

age body (case) and the die junction temperature per watt of power consumption. The junction-to-board ( $\theta_{JB}$ ) value similarly reports the difference between the board and junction temperature. The junction-to-ambient ( $\theta_{JA}$ ) value reports the temperature difference per watt between the ambient environment and the junction temperature. The  $\theta_{JA}$  value is reported at different air velocities, measured in linear feet per minute (LFM). The “Still Air (0 LFM)” column shows the  $\theta_{JA}$  value in a system without a fan. The thermal resistance drops with increasing air flow.

Table 85: Spartan-3 Package Thermal Characteristics

Package	Device	Junction-to-Case ( $\theta_{JC}$ )	Junction-to-Board ( $\theta_{JB}$ )	Junction-to-Ambient ( $\theta_{JA}$ ) at Different Air Flows				Units
				Still Air (0 LFM)	250 LFM	500 LFM	750 LFM

## VQ100: 100-lead Very-thin Quad Flat Package

The XC3S50 and the XC3S200 devices are available in the 100-lead very-thin quad flat package, VQ100. Both devices share a common footprint for this package as shown in [Table 86](#) and [Figure 42](#).

All the package pins appear in [Table 86](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

### Pinout Table

Table 86: VQ100 Package Pinout

## CP132: 132-ball Chip-Scale Package

The XC3S50 is available in the 132-ball chip-scale package, CP132. The pinout and footprint for this package appear in [Table 88](#) and [Figure 44](#).

All the package pins appear in [Table 88](#) and are sorted by bank number, then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The CP132 footprint has eight I/O banks. However, the voltage supplies for the two I/O banks along an edge are connected together internally. Consequently, there are four output voltage supplies, labeled VCCO\_TOP, VCCO\_RIGHT, VCCO\_BOTTOM, and VCCO\_LEFT.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

## TQ144: 144-lead Thin Quad Flat Package

The XC3S50, the XC3S200, and the XC3S400 are available in the 144-lead thin quad flat package, TQ144. Consequently, there is only one footprint for this package as shown in [Table 90](#) and [Figure 44](#).

The TQ144 package only has four separate VCCO inputs, unlike the other packages, which have eight separate VCCO inputs. The TQ144 package has a separate VCCO input for the top, bottom, left, and right. However, there are still eight separate I/O banks, as shown in [Table 90](#) and [Figure 44](#). Banks 0 and 1 share the VCCO\_TOP input, Banks 2 and 3 share the VCCO\_RIGHT input, Banks 4 and 5 share the VCCO\_BOTTOM input, and Banks 6 and 7 share the VCCO\_LEFT input.

All the package pins appear in [Table 90](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

## User I/Os by Bank

Table 91 indicates how the available user-I/O pins are distributed between the eight I/O banks on the TQ144 package.

Table 91: User I/Os Per Bank in TQ144 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	10	5	0	2	1	2
	1	9	4	0	2	1	2
Right	2	14	10	0	2	2	0
	3	15	11	0	2	2	0
Bottom	4	11	0	6	2	1	2
	5	9	0	6	0	1	2
Left	6	14	10	0	2	2	0
	7	15	11	0	2	2	0

TQ144 Footprint

DS099-4\_08\_121103

Figure 44: TQ144 Package Footprint (top view). Note pin 1 indicator in top-left corner and logo orientation.

51	I/O: Unrestricted, general-purpose user I/O	12	DUAL: Configuration pin, then possible user I/O	12	VREF: User I/O or input voltage reference for bank
14	DCI: User I/O or reference resistor input for bank	8	GCLK: User I/O or global clock buffer input	12	VCCO: Output voltage supply for bank
7	CONFIG: Dedicated configuration pins	4	JTAG: Dedicated JTAG port pins	4	VCCINT: Internal core voltage supply (+1.2V)
0	N.C.: No unconnected pins in this package	16	GND: Ground	4	VCCAUX: Auxiliary voltage supply (+2.5V)

## PQ208: 208-lead Plastic Quad Flat Pack

The 208-lead plastic quad flat package, PQ208, supports three different Spartan-3 devices, including the XC3S50, the XC3S200, and the XC3S400. The footprints for the XC3S200 and XC3S400 are identical, as shown in [Table 92](#) and [Figure 45](#). The XC3S50, however, has fewer I/O pins resulting in 17 unconnected pins on the PQ208 package, labeled as “N.C.” In [Table 92](#) and [Figure 45](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 92](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S50 pinout and the pinout for the XC3S200 and XC3S400, then that difference is highlighted in [Table 92](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S50 that maps to a user-I/O pin on the XC3S200 and XC3S400. If the table entry is shaded tan, then the unconnected pin on the XC3S50 maps to a VREF-type pin on the XC3S200 and XC3S400. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S50 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S50 device to an XC3S200 or XC3S400 FPGA without changing the printed circuit board.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

### User I/Os by Bank

Table 93 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S50 in the PQ208 package. Similarly, Table 94 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S200 and XC3S400 in the PQ208 package.

Table 93: User I/Os Per Bank for XC3S50 in PQ208 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	15	9	0	2	2	2
	1	15	9	0	2	2	2

## PQ208 Footprint

### Left Half of Package (top view)

#### XC3S50

(124 max. user I/O)

72 I/O: Unrestricted, general-purpose user I/O

16 VREF: User I/O or input voltage reference for bank

17 N.C.: Unconnected pins for XC3S50 (◆)

#### XC3S200, XC3S400

(141 max user I/O)

83 I/O: Unrestricted, general-purpose user I/O

22 VREF: User I/O or input voltage reference for bank

0 N.C.: No unconnected pins in this package

#### All devices

12 DUAL: Configuration pin, then possible user I/O

8 GCLK: User I/O or global clock buffer input

16 DCI: User I/O or reference resistor input for bank

7 CONFIG: Dedicated configuration pins

4 JTAG: Dedicated JTAG port pins

4 VCCINT: Internal core voltage supply (+1.2V)

12 VCCO: Output voltage supply for bank

8 VCCAUX: Auxiliary voltage supply (+2.5V)

28 GND: Ground

## FT256: 256-lead Fine-pitch Thin Ball Grid Array

The 256-lead fine-pitch thin ball grid array package, FT256, supports three different Spartan-3 devices, including the XC3S200, the XC3S400, and the XC3S1000. The footprints for all three devices are identical, as shown in [Table 95](#) and [Figure 46](#).

All the package pins appear in [Table 95](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

## FG320: 320-lead Fine-pitch Ball Grid Array

The 320-lead fine-pitch ball grid array package, FG320, supports three different Spartan-3 devices, including the XC3S400, the XC3S1000, and the XC3S1500. The footprint for all three devices is identical, as shown in [Table 97](#) and [Figure 47](#).

The FG320 package is an 18 x 18 array of solder balls minus the four center balls.

All the package pins appear in [Table 97](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

## FG456: 456-lead Fine-pitch Ball Grid Array

The 456-lead fine-pitch ball grid array package, FG456, supports four different Spartan-3 devices, including the XC3S400, the XC3S1000, the XC3S1500, and the XC3S2000. The footprints for the XC3S1000, the XC3S1500, and the XC3S2000 are identical, as shown in [Table 99](#) and [Figure 48](#). The XC3S400, however, has fewer I/O pins which consequently results in 69 unconnected pins on the FG456 package, labeled as “N.C.” In [Table 99](#) and [Figure 48](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 99](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S400 pinout and the pinout for the XC3S1000, the XC3S1500, or the XC3S2000, then that difference is highlighted in [Table 99](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S400 that maps to a user-I/O pin on the XC3S1000, XC3S1500, and XC3S2000. If the table entry is shaded tan, then the unconnected pin on the XC3S400 maps to a VREF-type pin on the XC3S1000, the XC3S1500, or the XC3S2000. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S400 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S400 device to an XC3S1000, an XC3S1500, or an XC3S2000 FPGA without changing the printed circuit board.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

## User I/Os by Bank

Table 100 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S400 in the FG456 package. Similarly, Table 101 shows how the avail-

able user-I/O pins are distributed between the eight I/O banks for the XC3S1000, XC3S1500, and XC3S2000 in the FG456 package.

Table 100: User I/Os Per Bank for XC3S400 in FG456 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	35	27	0	2	4	2
	1	35	27	0	2	4	2

## FG676: 676-lead Fine-pitch Ball Grid Array

The 676-lead fine-pitch ball grid array package, FG676, supports four different Spartan-3 devices, including the XC3S1000, the XC3S1500, the XC3S2000, and the XC3S4000. All four have nearly identical footprints but are slightly different due to unconnected pins on the XC3S1000 and XC3S1500. For example, because the XC3S1000 has fewer I/O pins, this device has 98 unconnected pins on the FG676 package, labeled as “N.C.” In [Table 102](#) and [Figure 49](#), these unconnected pins are indicated with a black diamond symbol (◆). The XC3S1500, however, has only two unconnected pins, also labeled “N.C.” in the pinout table but indicated with a black square symbol (■).

All the package pins appear in [Table 102](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S1000, the XC3S1500, the XC3S2000, and the XC3S4000 pinouts, then that difference is highlighted in [Table 102](#). If the table entry is shaded grey, then there is an unconnected pin on either the XC3S1000 or XC3S1500 that maps to a user-I/O pin on the XC3S2000 and XC3S4000. If the table entry is shaded tan, then the unconnected pin on either the XC3S1000 or XC3S1500 maps to a VREF-type pin on the XC3S2000 and XC3S4000. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S1000 or XC3S1500 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S1000 through to the XC3S4000 FPGA without changing the printed circuit board.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

**Notes:**

- XC3S4000 is pin compatible but uses alternate differential pairs on six package balls.

**User I/Os by Bank**

Table 103 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S1000 in the FG676 package. Similarly, Table 104 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S1500 in the FG676 package. Finally, Table 105 shows the same information for the XC3S2000 and XC3S4000 in the FG676 package.

Table 103: User I/Os Per Bank for XC3S1000 in FG676 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	49	40	0	2	5	2
	1	50	41	0	2	5	2
Right	2	48	41	0	2	5	0
	3	48	41	0	2	5	0
Bottom	4	50	35	6	2	5	2
	5	50	35	6	2	5	2
Left	6	48	41	0	2	5	0
	7	48	41	0	2	5	0

Table 104: User I/Os Per Bank for XC3S1500 in FG676 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	62	52	0	2	6	2

Table 105: User I/Os Per Bank for XC3S2000 and XC3S4000 in FG676 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	62	52	0	2	6	2
	1	61	51	0	2	6	2
Right	2	61	53	0	2	6	0
	3	60	52	0	2	6	0
Bottom	4	63	47	6	2	6	2
	5	61	45	6	2	6	2
Left	6	61	53	0	2	6	0
	7	60	52	0	2	6	0

### FG676 Footprint

#### Left Half of Package (top view)

##### XC3S1000

(391 max. user I/O)

**315** I/O: Unrestricted, general-purpose user I/O

**40** VREF: User I/O or input voltage reference for bank

**98** N.C.: Unconnected pins for XC3S1000 (◆)

##### XC3S1500

(487 max user I/O)

**403** I/O: Unrestricted, general-purpose user I/O

**48** VREF: User I/O or input voltage reference for bank

**2** N.C.: Unconnected pins for XC3S1500 (■)

##### XC3S2000, XC3S4000

(489 max user I/O)

**405** I/O: Unrestricted, general-purpose user I/O

**48** VREF: User I/O or input voltage reference for bank

**0** N.C.: No unconnected pins

##### All devices

**12** DUAL: Configuration pin, then possible user I/O

**8** GCLK: User I/O or global clock buffer input

**16** DCI: User I/O or reference resistor input for bank

**7** CONFIG: Dedicated configuration pins

**4** JTAG: Dedicated JTAG port pins

**20** VCCINT: Internal core voltage supply (+1.2V)

**64** VCCO: Output voltage supply for bank

**16** VCCAUX: Auxiliary voltage supply (+2.5V)

**76** GND: Ground

Right Half of Package (top view)

**Notes:**  
 1. Differential pair assignments shown in parentheses on balls H20, H21, H22, H23, H24, and J21 are for XC3S4000 only.

## FG900: 900-lead Fine-pitch Ball Grid Array

The 900-lead fine-pitch ball grid array package, FG900, supports three different Spartan-3 devices, including the XC3S2000, the XC3S4000, and the XC3S5000. The footprints for the XC3S4000 and XC3S5000 are identical, as shown in [Table 106](#) and [Figure 50](#). The XC3S2000, however, has fewer I/O pins which consequently results in 68 unconnected pins on the FG900 package, labeled as “N.C.” In [Table 106](#) and [Figure 50](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 106](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S2000 pinout and the pinout for the XC3S4000 and XC3S5000, then that difference is highlighted in [Table 106](#). If the table entry is shaded, then there is an unconnected pin on the XC3S2000 that maps to a user-I/O pin on the XC3S4000 and XC3S5000.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

### User I/Os by Bank

Table 107 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S2000 in the FG900 package. Similarly, Table 108 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 and XC3S5000 in the FG900 package.

Table 107: User I/Os Per Bank for XC3S2000 in FG900 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	71	62	0	2	5	2
	1	71	62	0	2	5	2
Right	2	69	61	0	2	6	0
	3	71	62	0	2	7	0
Bottom	4	72	57	6	2	5	2
	5	71	55	6	2	6	2
Left	6	69	60	0	2	7	0
	7	71	62	0	2	7	0

Table 108: User I/Os Per Bank for XC3S4000 and XC3S5000 in FG900 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	79	70	0	2	5	2
	1	79	70	0	2	5	2
Right	2	79	71	0	2	6	0
	3	79	70	0	2	7	0
Bottom	4	80	65	6	2	5	2
	5	79	63	6	2	6	2
Left	6	79	70	0	2	7	0
	7	79	70	0	2	7	0

### FG900 Footprint

#### Left Half of Package (top view)

##### XC3S2000

(565 max. user I/O)

**481** I/O: Unrestricted, general-purpose user I/O

**48** VREF: User I/O or input voltage reference for bank

**68** N.C.: Unconnected pins for XC3S2000 (◆)

##### XC3S4000, XC3S5000

(633 max user I/O)

**549** I/O: Unrestricted, general-purpose user I/O

**48** VREF: User I/O or input voltage reference for bank

**0** N.C.: No unconnected pins in this package

##### All devices

**12** DUAL: Configuration pin, then possible user I/O

**8** GCLK: User I/O or global clock buffer input

**16** DCI: User I/O or reference resistor input for bank

**7** CONFIG: Dedicated configuration pins

**4** JTAG: Dedicated JTAG port pins

**32** VCCINT: Internal core voltage supply (+1.2V)

**80** VCCO: Output voltage supply for bank

**24** VCCAUX: Auxiliary voltage supply (+2.5V)

**120** GND: Ground

## FG1156: 1156-lead Fine-pitch Ball Grid Array

The 1,156-lead fine-pitch ball grid array package, FG1156, supports two different Spartan-3 devices, namely the XC3S4000 and the XC3S5000. The XC3S4000, however, has fewer I/O pins, which consequently results in 73 unconnected pins on the FG1156 package, labeled as “N.C.” In [Table 109](#) and [Figure 51](#), these unconnected pins are indicated with a black diamond symbol (◆).

The XC3S5000 has a single unconnected package pin, ball AK31, which is also unconnected for the XC3S4000.

All the package pins appear in [Table 109](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S4000 and XC3S5000 pinouts, then that difference is highlighted in [Table 109](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S4000 that maps to a user-I/O pin on the XC3S5000. If the table entry is shaded tan, which only occurs on ball L29 in I/O Bank 2, then the unconnected pin on the XC3S4000 maps to a VREF-type pin on the XC3S5000. If the other VREF\_2 pins all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S4000 to the same VREF\_2 voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S4000 to the XC3S5000 FPGA without changing the printed circuit board.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at [http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip).

### User I/Os by Bank

Table 110 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 in the FG1156 package. Similarly, Table 111 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S5000 in the FG1156 package.

Table 110: User I/Os Per Bank for XC3S4000 in FG1156 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	90	79	0	2	7	2
	1	90	79	0	2	7	2
Right	2	88	80	0	2	6	0
	3	88	79	0	2	7	0
Bottom	4	90	73	6	2	7	2
	5	90	73	6	2	7	2
Left	6	88	79	0	2	7	0
	7	88	79	0	2	7	0

Table 111: User I/Os Per Bank for XC3S5000 in FG1156 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	100	89	0	2	7	2
	1	100	89	0	2	7	2

## Revision History

Date	Version No.	Description
04/03/03	1.0	Initial Xilinx release.
04/21/03	1.1	Added information on the VQ100 package footprint, including a complete pinout table (Table 86) and footprint diagram (Figure 42). Updated Table 84 with final I/O counts for the VQ100 package. Also added final differential I/O pair counts for the TQ144 package. Added clarifying comments to HSWAP_EN pin description on page 109. Updated the footprint diagram for the FG900 package shown in Figure 50a and Figure 50b. Some thick lines separating I/O banks were incorrect. Made cosmetic changes to Figure 38, Figure 40, and Figure 41. Updated Xilinx hypertext links. Added XC3S200 and XC3S400 to Pin Name column in Table 90.
05/12/03	1.1.1	AM32 pin was missing GND label in FG1156 package diagram (Figure 51).
07/11/03	1.1.2	Corrected misspellings of GCLK in Table 68 and Table 69. Changed CMOS25 to LVCMOS25 in <b>Dual-Purpose Pin I/O Standard During Configuration</b> section. Clarified references to Module 2. For XC3S5000 in FG1156 package, corrected N.C. symbol to a black square in Table 109, key, and package drawing.
07/29/03	1.2	Corrected pin names on FG1156 package. Some package balls incorrectly included LVDS pair names. The affected balls on the FG1156 package include G1, G2, G33, G34, U9, U10, U25, U26, V9, V10, V25, V26, AH1, AH2, AH33, AH34. The number of LVDS pairs is unaffected. Modified affected balls and re-sorted rows in Table 109. Updated affected balls in Figure 51. Also updated ASCII and Excel electronic versions of FG1156 pinout.
08/19/03	1.2.1	Removed 100 MHz ConfigRate option in <b>CCLK: Configuration Clock</b> section and in Table 79. Added note that TDO is a totem-pole output in Table 76.
10/09/03	1.2.2	Some pins had incorrect bank designations and were improperly sorted in Table 92. No pin names or functions changed. Renamed DCI_IN to DCI and added black diamond to N.C. pins in Table 92. In Figure 45, removed some extraneous text from pin 106 and corrected spelling of pins 45, 48, and 81.
12/17/03	1.3	Added FG320 pin tables and pinout diagram ( <b>FG320: 320-lead Fine-pitch Ball Grid Array</b> ). Made cosmetic changes to the TQ144 footprint (Figure 44), the PQ208 footprint (Figure 45), the FG676 footprint (Figure 49), and the FG900 footprint (Figure 50). Clarified wording in <b>Precautions When Using the JTAG Port in 3.3V Environments</b> section.
02/27/04	1.4	Clarified wording in <b>Using JTAG Port After Configuration</b> section. In Table 80, reduced package height for FG320 and increased maximum I/O values for the FG676, FG900, and FG1156 packages.
07/13/04	1.5	Added information on lead-free (Pb-free) package options to the <b>Package Overview</b> section plus Table 80 and Table 82. Clarified the VRN_# reference resistor requirements for I/O standards that use single termination as described in the <b>DCI Termination Types</b> section and in Figure 40b. Graduated from Advance Product Specification to Product Specification.
08/24/04	1.5.1	Removed XC3S2000 references from <b>FG1156: 1156-lead Fine-pitch Ball Grid Array</b> .
01/17/05	1.6	Added XC3S50 in CP132 package option. Added XC3S2000 in FG456 package option. Added XC3S4000 in FG676 package option. Added <b>Selecting the Right Package Option</b> section. Modified or added Table 80, Table 82, Table 83, Table 84, Table 88, Table 89, Table 99, Table 101, Table 102, Table 105, Figure 43, and Figure 49.
08/19/05	1.7	Removed term "weak" from the description of pull-up and pull-down resistors. Added <b>IDCODE Register</b> values. Added signal integrity precautions to <b>CCLK: Configuration Clock</b> and indicated that CCLK should be treated as an I/O during Master mode in Table 78.
04/03/06	2.0	Added <b>Package Thermal Characteristics</b> . Updated Figure 39 to make it a more obvious example. Added detail about which pins have dedicated pull-up resistors during configuration, regardless of the HSWAP_EN value to Table 69 and to <b>Pin Behavior During Configuration</b> . Updated <b>Precautions When Using the JTAG Port in 3.3V Environments</b> .
04/26/06	2.1	Corrected swapped data row in Table 85. The Theta-JA with zero airflow column was swapped with the Theta-JC column. Made additional notations on CONFIG and JTAG pins that have pull-up resistors during configuration, regardless of the HSWAP_EN input.
