

SANYO**LA4558****2-Channel AF Power Amplifier****Features**

- Low quiescent current.
- On-chip 2 channels permitting use in stereo and bridge amplifier applications.
- High output.
- Minimum number of external parts required.
(9 pcs. minimum)
- Good ripple rejection (60dB).
- Soft tone at the output saturation mode.
- Good channel separation.
- Easy thermal design.
- Small pop noise at the time of power supply ON/OFF.

Package Dimensions

unit:mm

3022A-DIP12F

SANYO : DIP12F

Specifications**Absolute Maximum Ratings** at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V _{CC} max	Quiescent	15	V
		Operating	12	V
Allowable power dissipation	P _d max	With recommended PCB	4	W
Operating temperature	T _{opr}		-20 to +75	°C
Storage temperature	T _{stg}		-55 to +150	°C

Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	V _{CC}		7.5 to 9.0	V
Recommended load resistance	R _L	Stereo	3 to 8	Ω
		BTL	8	Ω
Operating voltage range	V _{CCop}		4.5 to 12	V

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

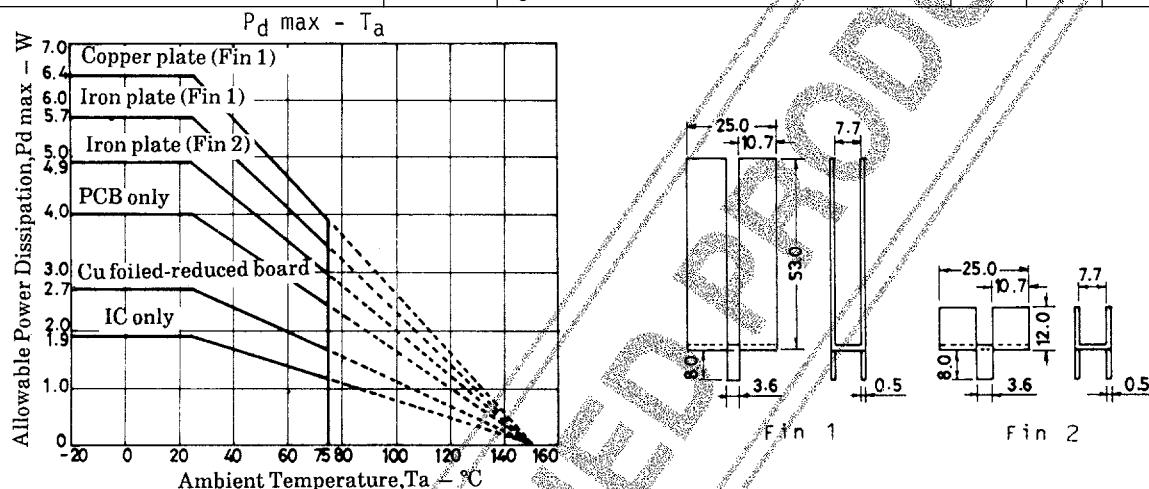

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

LA4558

Operating Characteristics at $T_a = 25^\circ\text{C}$, $V_{CC} = 9\text{V}$, $f = 1\text{kHz}$, $R_g = 600\Omega$, $R_L = 4\Omega$, $VG = 50\text{dB}$,
See specified Test Circuit.

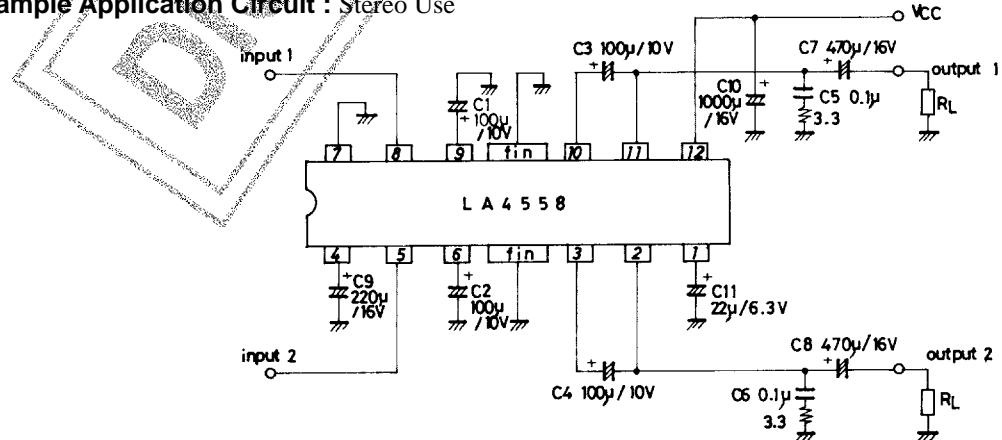

Parameter	Symbol	Conditions	Ratings			Unit	
			min	typ	max		
Quiescent current	I _{c₀}	R _g =0		20	40	mA	
Voltage gain	V _G	V _{IN} =-50dBm	48	50	52	dB	
Voltage gain difference	ΔV _G	V _{IN} =-50dBm			±1	dB	
Output power	P _O	THD=10%, Stereo		1.7	2.4	W	
		THD=10%, BTL (R _L =8Ω)			4.5	W	
Total harmonic distortion	THD	P _O =250mW			0.3	1.0	%
Input resistance	r _i		21	30		kΩ	
Output noise voltage	V _{NO}	R _g =0, stereo			0.5	1.0	mV
		R _g =10kΩ, stereo			0.8	2.0	mV
Ripple rejection	R _r	R _g =0, f _R =100Hz, V _{CCR} =0dBm	55	60		dB	
Crosstalk	C _T	R _g =10kΩ, V _O =0dBm	45	55		dB	

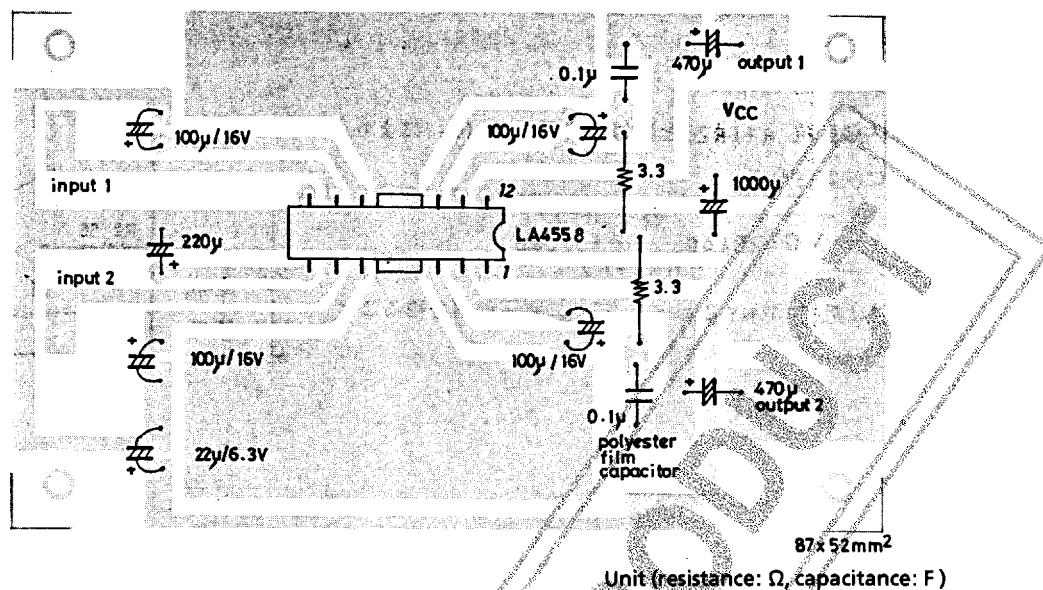

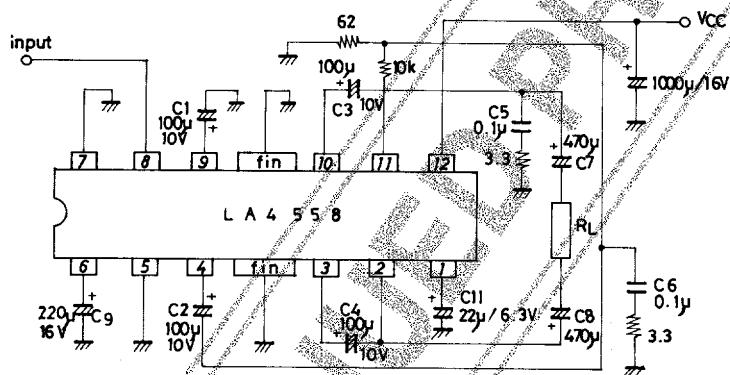

Ambient Temperature **Equivalent Circuit Block Diagram**

Sample Application Circuit : Stereo Use

Sample Printed Circuit Pattern (Cu-foiled side)**Sample Application Circuit : Bridge Amplifier Use****Description of External Parts**

C1 (C2) : Feedback capacitor. The low cutoff frequency is determined by the following formula.

$$f_L = \frac{1}{2\pi C_1 R_F}$$

f_L : Low cutoff frequency
 R_F : Feedback resistance

Since this capacitor as well as decoupling capacitor affects the starting time, the capacitor value must be fixed with the necessary low frequency band fully considered.

C3 (C4) : Bootstrap capacitor. The output at low frequencies depends on this capacitor. Decreasing the capacitor value lowers the output at low frequencies. A capacitor value of 47μF or more is required.

C5 (C6) : Oscillation blocking capacitor. Use a polyester film capacitor that is good in high frequency response and temperature characteristic. The use of an electrolytic capacitor, ceramic capacitor may cause oscillation to occur at low temperatures.

C7 (C8) : Output capacitor. The low cutoff frequency is determined by the following formula.

$$f_L = \frac{1}{2\pi C_7 R_L}$$

f_L : Low cutoff frequency
 R_L : Load resistance

To make the low frequency response in the bridge amplifier mode identical with that in the stereo mode, the capacitor value must be doubled.

C9 : Decoupling capacitor CD1. Used for the ripple filter. Since the rejection effect is saturated at a certain capacitor value, it is meaningless to increase the capacitor value more than needed. This capacitor, being also used for the time constant of the muting circuit, affects the starting time.

C10 : Power source capacitor.

C11 : Decoupling capacitor CD2. Used for the ripple filter. Particularly effective for transient characteristic.

Application Circuits

Voltage gain adjust

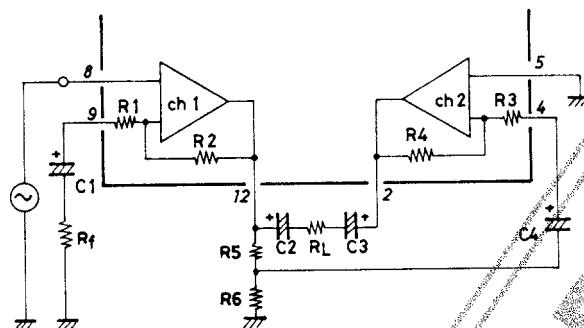

- Stereo mode

The voltage gain is determined by on-chip resistor R1 (R2) and external feedback resistor R_{NF} as follows :

$$VG=20 \log \frac{R1}{R_{NF}+R2} [\text{dB}]$$

Any voltage gain can be obtained by external resistor R_{NF} .

- Bridge amplifier mode

The CH1 is a noninverting amplifier and the CH2 is an inverting amplifier. The total voltage gain, being apparently higher than that of the CH1 by 6dB, is approximately calculated by the following formula.

$$VG=20\log R2/R1+6 (\text{dB})$$

To reduce the voltage gain, R_f is connected and the following formula is used.

$$VG=20\log R2/R_f=R1+6 (\text{dB})$$

Proper cares in using LA4558-applied set

- Slider contact noise of variable resistor

Since the input circuit uses PNP transistors, no input coupling capacitor is required. However, if slider contact noise of the variable resistor presents any problem, connect a capacitor in series with input.

- Pop noise

If pop noise generated at the time of power ON/OFF disturbs you, connect a resistor of 500Ω to 1kΩ across the middle point and GND.

Thermal Design

Since the DIP-12F package is such that the Cu-foiled area of the printed circuit board is used to dissipate heat, make the Cu-foiled area in the vicinity of the heat sink of the IC as large as possible when designing the printed circuit board. Power dissipation P_d is increased depending on the supply voltage and load. So, it is recommended to use the printed circuit board together with the heat sink. The following is a formula to be used to calculate P_d (for stereo use). For AC power supply, however, it is recommended to actually measure P_d on the transformer of each set. For bridge amplifier use, P_d is calculated at 1/2 of the load.

(1) DC power supply

$$P_{d\max} = \frac{V_{CC}^2}{\pi^2 R_L} + I_{CC} \cdot V_{CC} \quad (2\text{-channel}) \dots \quad (1) \quad (\text{For stereo use})$$

(2) AC power supply

V_{CC2} : Supply voltage at quiescent mode

V_{CC} (Pd) : Supply voltage at Pd max

V_{CC1} : Supply voltage at maximum output

r : Voltage regulation $\frac{V_{CC2} - V_{CC1}}{V_{CC1}}$

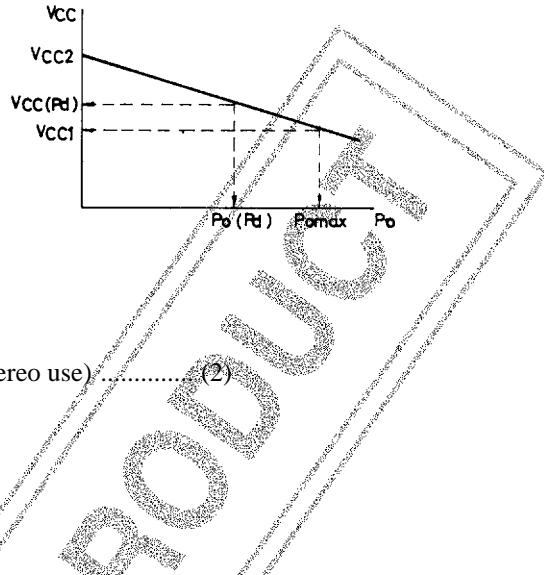

I_{CC0} : Quiescent current

Line regulation

$$Pd_{max} = \frac{V_{CC}(Pd)^2}{\pi^2 R_L} + I_{CC} \cdot V_{CC}(Pd) \quad (\text{For stereo use}) \quad (2)$$

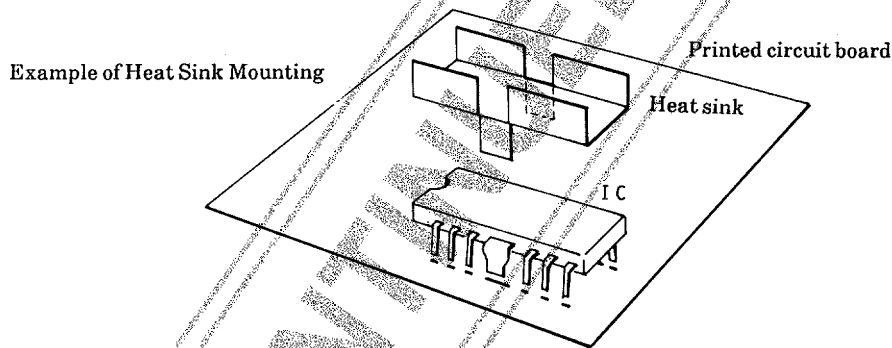

where

$$V_{CC\text{ (Pd)}} = \frac{(1+r) V_{CC1}}{1 + \frac{r \cdot V_{CC1}}{\sqrt{2} \cdot \pi \cdot R_L} \times \sqrt{\frac{R_L}{P_{o \text{ max}}}}}$$

Example of Heat Sink Mounting Method

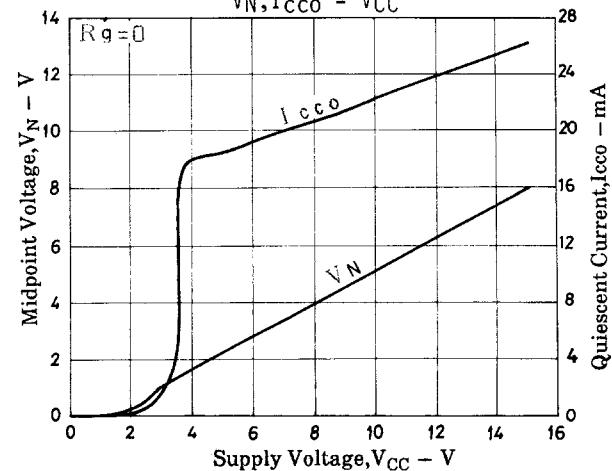

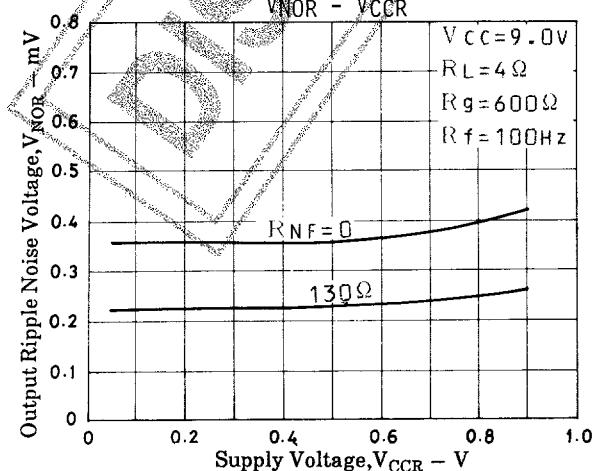

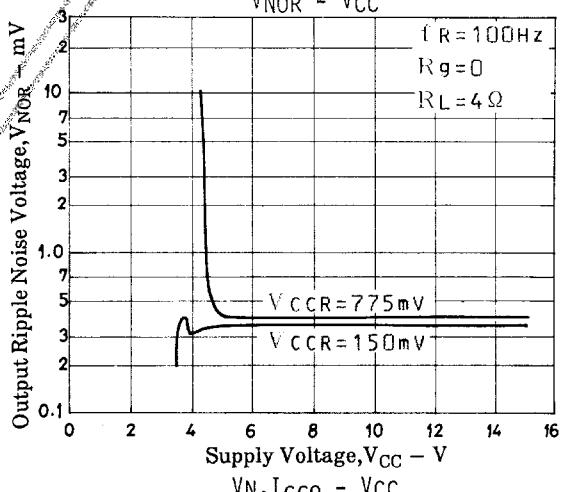

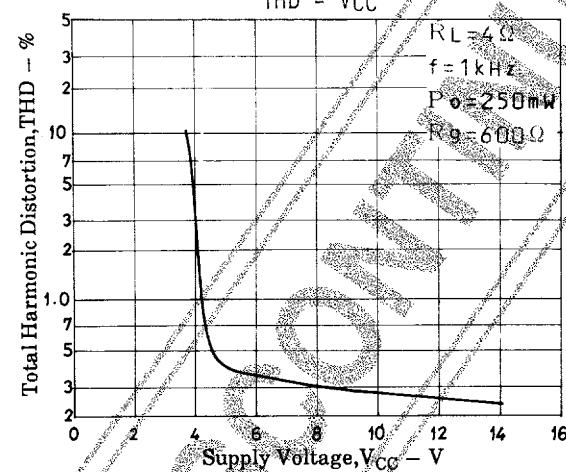

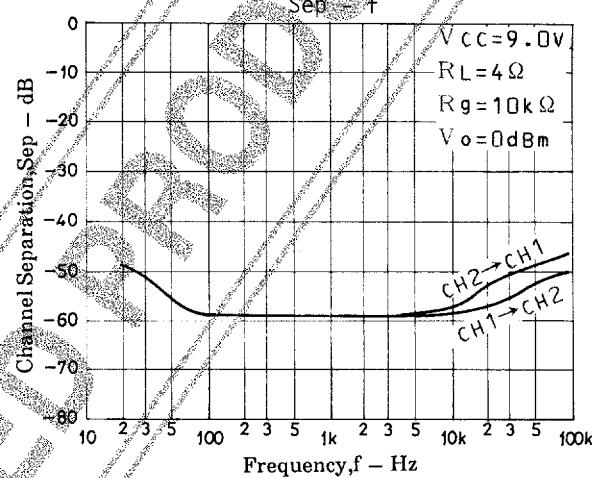

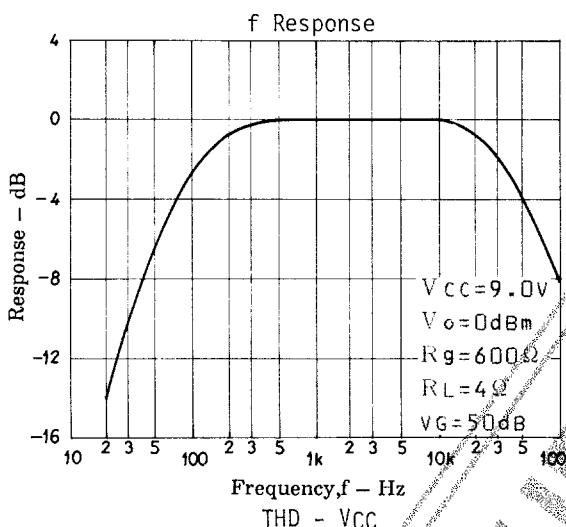

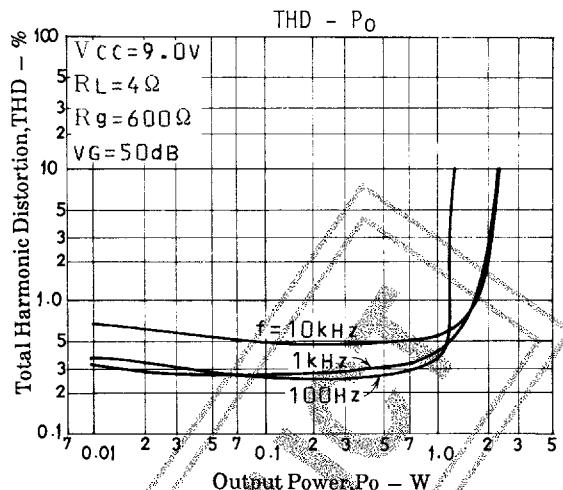

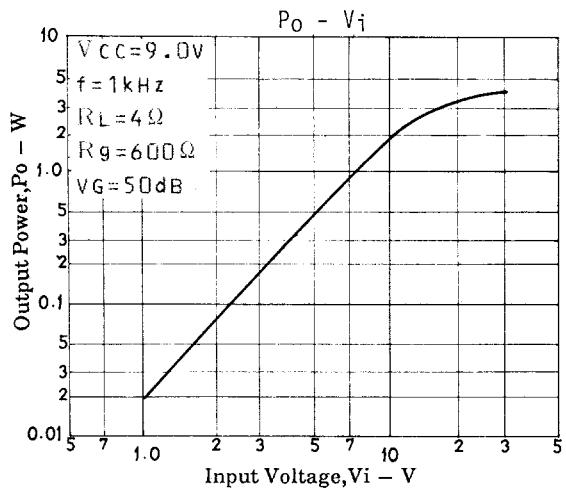

The heat sink must be of such a shape as to be able to dissipate heat from the IC plastic area and fin area and is soldered to the printed circuit board as shown below. For the size of the heat sink, refer to the Pd – Ta characteristic. The material of the heat sink is recommended to be copper or iron which is solderable. It is recommended to apply silicone grease to the IC plastic area to reduce thermal resistance between the heat sink and the IC plastic area.

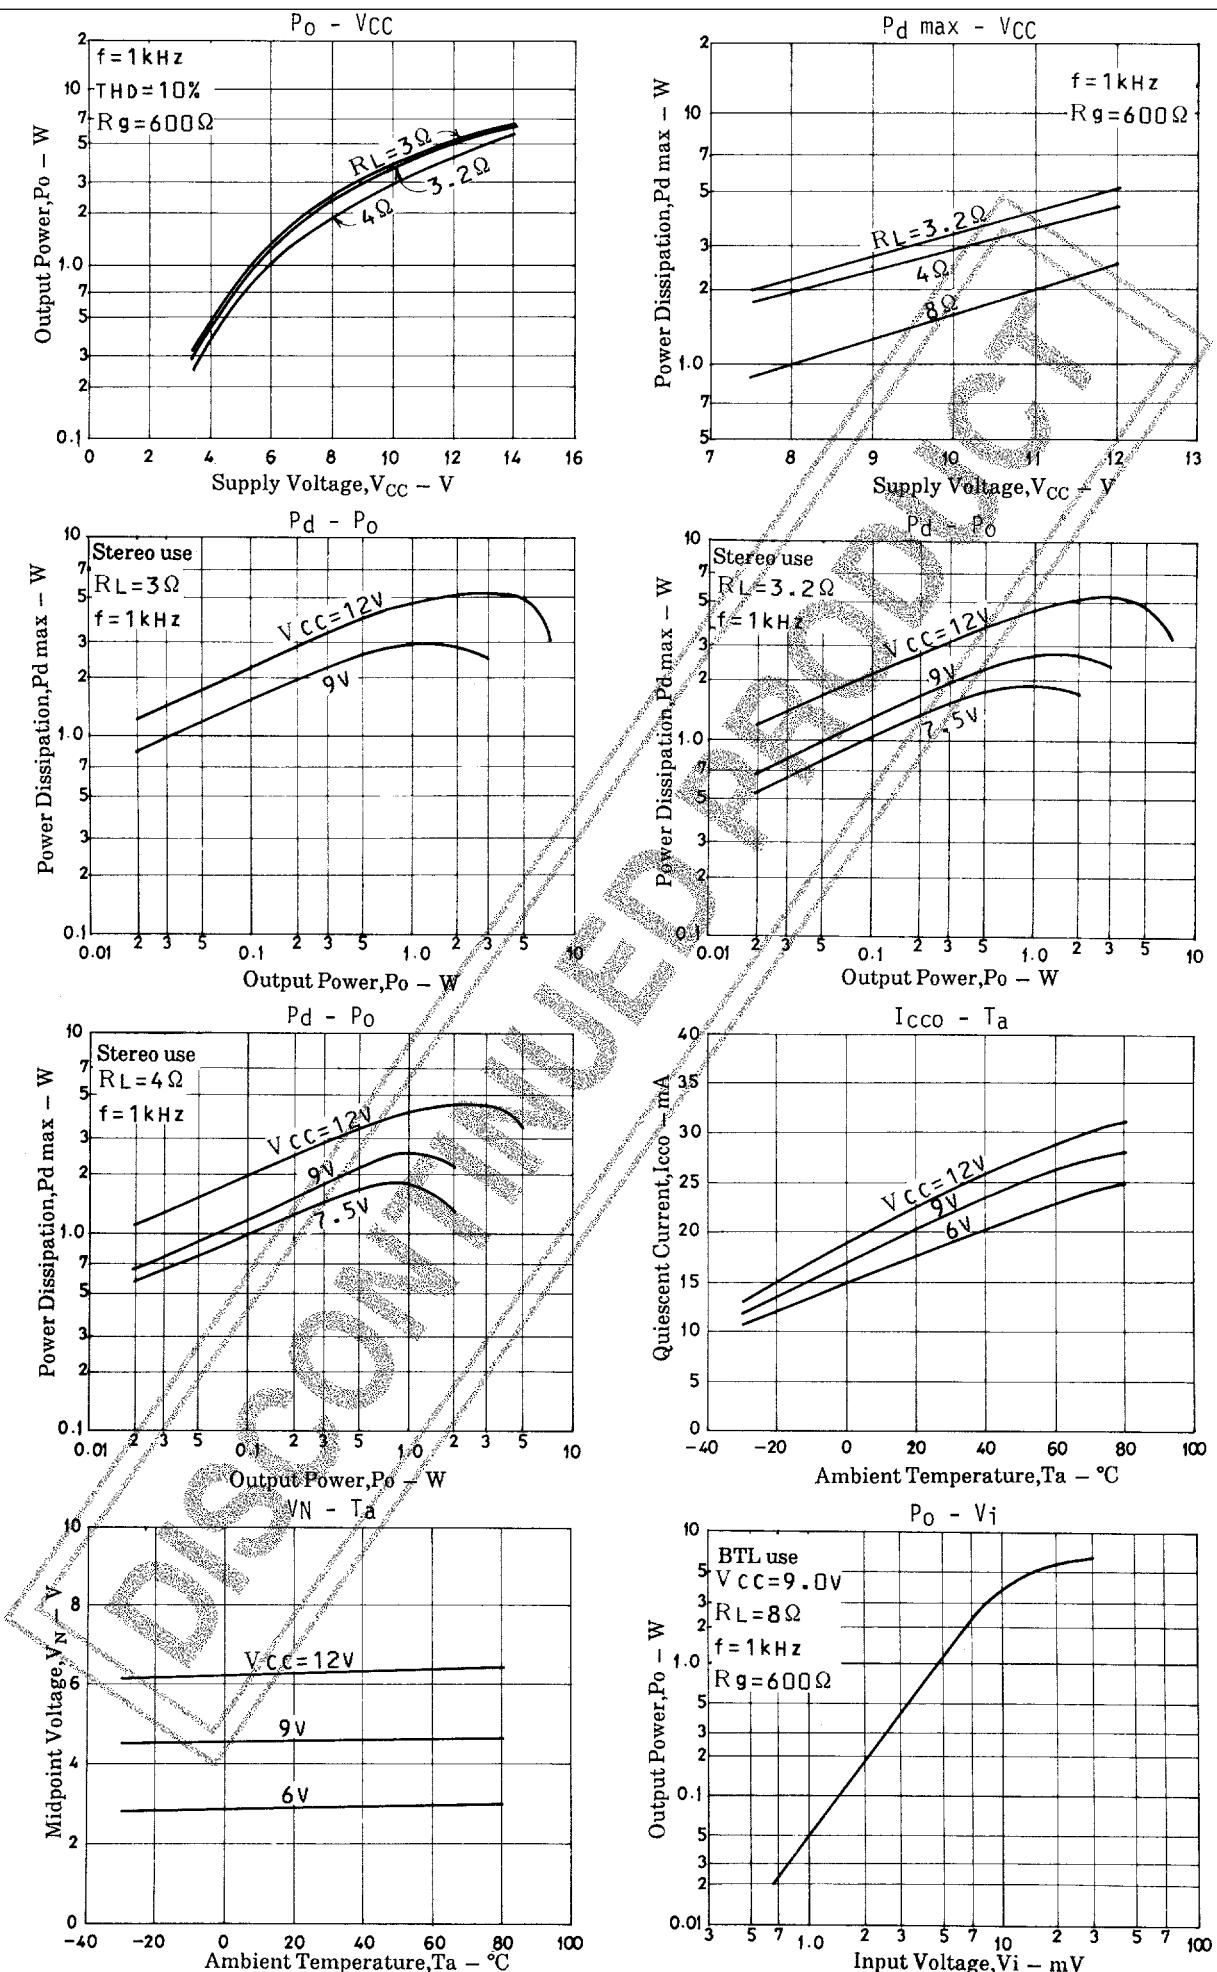

Proper Cares in Using IC

1. If the IC is used in the vicinity of the maximum ratings, even a slight variation in conditions may cause the maximum ratings to be exceeded, thereby leading to breakdown. Allow an ample margin of variation for supply voltage, etc. and use the IC in the range where the maximum ratings are not exceeded.
 2. Pin-to-pin short : If power is applied when the space between pins is shorted, breakdown or deterioration may occur. When mounting the IC on the board and applying power, make sure that the space between pins is not shorted with solder, etc.
 3. Load short : If the IC is used with the load shorted for a long time, breakdown or deterioration may occur. Be sure not to short the load.
 4. When the IC is used in radios or radio cassette tape recorders, keep a good distance between IC and bar antenna.
 5. When making the board, refer to the sample printed circuit pattern.
 6. It should be noted that some plug jacks to be used for connecting to the external speaker are such that both poles are shorted once when connecting.
