DESCRIPTION

The HEF4028B is a 4-bit BCD to 1-of-10 active HIGH decoder. A 1-2-4-8 BCD code applied to inputs A_0 to A_3 causes the selected output to be HIGH, the other nine will be LOW. If desired, the device may be used as a 1-of-8 decoder with enable; 3-bit octal inputs are applied to inputs A_0, A_1 and A_2 selecting an output O_0 to O_7. Input A_3 then becomes an active LOW enable, forcing the selected output LOW when A_3 is HIGH. The HEF4028B may also be used as an 8-output (O_0 to O_7) demultiplexer with A_0 to A_2 as address inputs and A_3 as an active LOW data input. The outputs are fully buffered for best performance.

Notes

1. H = HIGH state (the more positive voltage)
   L = LOW state (the less positive voltage)
2. Extraordinary states.
