2.25-A, WIDE-INPUT ADJUSTABLE SWITCHING REGULATOR

FEATURES

- **Up to 2.25-A Output Current at 85°C**
- **4.5-V to 18-V Input Voltage Range**
- **Wide-Output Voltage Adjust (0.9 V to 5.5 V)**
- **Efficiencies Up To 93%**
- **On/Off Inhibit**
- **Undervoltage Lockout (UVLO)**
- **Output Overcurrent Protection (Nonlatching, Auto-Reset)**
- **Overtemperature Protection**
- **Ambient Temperature Range: –40°C to 85°C**
- **Surface-Mount Package**

- **Safety Agency Approvals: UL/CUL 60950, EN60950**

APPLICATIONS

- **Telecommunications, Instumentation, and General-Purpose Circuits**

DESCRIPTION

The PTH08080W is a highly integrated, low-cost switching regulator module that delivers up to 2.25 A of output current. The PTH08080W sources output current at a much higher efficiency than a TO-220 linear regulator IC, thereby eliminating the need for a heat sink. Its small size (0.5×0.6 in) and flexible operation creates value for a variety of applications.

The input voltage range of the PTH08080W is from 4.5 V to 18 V, allowing operation from either a 5-V or 12-V input bus. Using state-of-the-art switched-mode power-conversion technology, the PTH08080W can step down to voltages as low as 0.9 V from a 5-V input bus, with less than 1 W of power dissipation. The output voltage can be adjusted to any voltage over the range, 0.9 V to 5.5 V, using a single external resistor. Operating features include an undervoltage lockout (UVLO), on/off inhibit, overcurrent protection, and overtemperature protection. Target applications include telecommunications, test and measurement applications, and high-end consumer products. This product is available in both through-hole and surface-mount package options, including tape and reel.

STANDARD APPLICATION
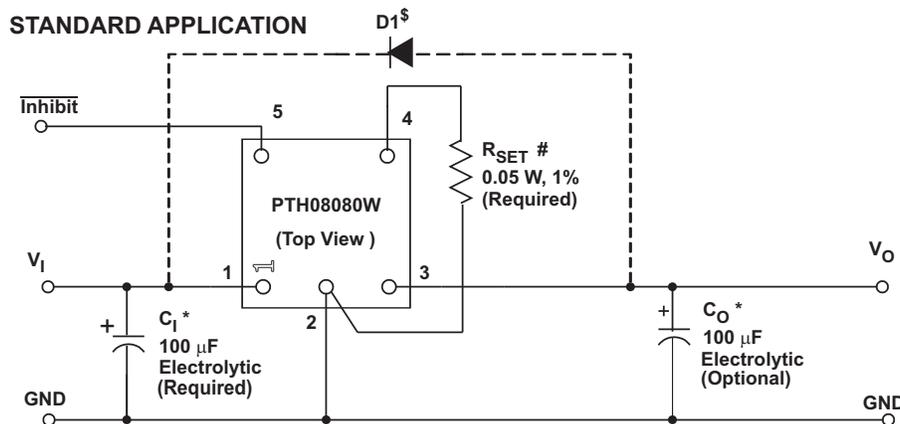

* See The Capacitor Application Information
\# See the Specification Table for the R_{SET} value.
\$ Diode is Required When $V_O \geq 5.25$ V and $V_I \geq 16$ V.

⚠ Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted[1]

				PTH08080W	UNIT
T_A	Operating free-air temperature	Over V_I range		−40 to 85	°C
T_S	Wave Solder temperature	Surface temperature of module body or pins	Suffix AH	235	°C
			Suffix AD	260	
	Solder reflow temperature		Suffix AS	235	
			Suffix AZ	260	
T_{stg}	Storage temperature			−55 to 125	°C

(1)   Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

		MIN	MAX	UNIT
V_I	Input voltage	4.5	18	V
T_A	Operating free-air temperature	−40	85	°C

PACKAGE SPECIFICATIONS

PTH08080W (Suffix AH and AS)		
Weight		1.5 grams
Flammability	Meets UL 94 V-O	
Mechanical shock	Per Mil-STD-883D, Method 2002.3, 1 ms, 1/2 sine, mounted	500 G [1]
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000 Hz	20 G [1]

(1)   Qualification limit.

ELECTRICAL CHARACTERISTICS

at 25°C free-air temperature, V_I = 12 V, V_O = 3.3 V, I_O = $I_O$max, C_I = 100 µF, C_O = 100 µF (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I_O	Output current	T_A = 85°C, natural convection airflow		0		2.25	A

	External output capacitance	Ceramic type (C_O)				220	µF
		Nonceramic type (C_O)			100 [5]	330 [6]	
		Equivalent series resistance (nonceramic)		10 [7]			mΩ
MTBF	Calculated reliability	Per Telcordia SR-332, 50% stress, T_A = 40°C, ground benign		48			10^6 Hr

(1) The set-point voltage tolerance is affected by the tolerance and stability of R_{SET}. The stated limit is unconditionally met if R_{SET} has a tolerance of 1% with 100 ppm/°C or better temperature stability.
(2) The minimum input voltage is 4.5 V or (V_O + 1.1) V, whichever is greater. The maximum input voltage is 18 V or V_O × 10, whichever is less.
(3) This control pin has an internal pull-up to 3 V (TYP). Do not place an internal pull-up on this pin. If it is left open-circuit, the module operates when input power is applied. A small low-leakage (< 100 nA) MOSFET is recommended for control. See the application information for further guidance.
(4) An external 100-µF electrolytic capacitor is required across the input (V_I and GND) for proper operation. Locate the capacitor close to the module.
(5) An external 100-µF electrolytic capacitor is optional across the output (V_O and GND). Locate the capacitor close to the module. Additional capacitance close to the load improves the response of the regulator to load transients.
(6) This is the calculated maximum capacitance. The minimum ESR limitation often results in a lower value. See the capacitor application information for further guidance.
(7) This is the typical ESR for all the electrolytic (nonceramic) capacitance. Use 14 mΩ as the minimum when calculating the total equivalent series resistance (ESR) using the maximum ESR values specified by the capacitor manufacturer.

PIN ASSIGNMENT

TERMINAL FUNCTIONS

| TERMINAL		I/O	DESCRIPTION
NAME	NO.		
V_I	1	I	The positive input voltage power node to the module, which is referenced to common GND.
GND	2		This is the common ground connection for the V_I and V_O power connections. It is also the 0-Vdc reference for the *Inhibit* and V_O *Adjust* control inputs.
V_O	3	O	The regulated positive power output with respect to the GND node.
V_O Adjust	4	I	A 1% resistor must be connected between this pin and GND (pin 1) to set the output voltage of the module higher than 0.9 V. If left open-circuit, the output voltage defaults to this value. The temperature stability of the resistor should be 100 ppm/°C (or better). The set-point range is from 0.9 V to 5.5 V. The electrical specification table gives the standard resistor value for a number of common output voltages. See the application information for further guidance.
$\overline{\text{Inhibit}}$	5	I	The Inhibit pin is an open-collector/drain-negative logic input that is referenced to GND. Applying a low-level ground signal to this input disables the module's output. When the Inhibit control is active, the input current drawn by the regulator is significantly reduced. If the Inhibit pin is left open-circuit, the module produces an output voltage whenever a valid input source is applied. Do not place an external pull-up on this pin.

APPLICATION INFORMATION

Adjusting the Output Voltage of the PTH08080W Wide-Output Adjust Power Modules

The *V$_O$ Adjust* control (pin 4) sets the output voltage of the PTH08080W product. The adjustment range is from 0.9 V to 5.5 V. The adjustment method requires the addition of a single external resistor, R$_{SET}$, that must be connected directly between the *V$_O$ Adjust* and *GND* (pin 2). Table 1 gives the standard external resistor for a number of common bus voltages, along with the actual voltage the resistance produces.

For other output voltages, the value of the required resistor can either be calculated using the following formula, or simply selected from the range of values given in Table 2. Figure 10 shows the placement of the required resistor.

$$R_{SET} = 10 \text{ k}\Omega \ \times \ \frac{0.891 \text{ V}}{V_{out} - 0.9 \text{ V}} \ - 1.82 \text{ k}\Omega$$

Table 1. Standard Values of R$_{SET}$ for Common Output Voltages

V$_O$ (Required)	R$_{set}$ (Standard Value)	V$_O$ (Actual)
5 V[1]	348 Ω	5.010 V
3.3 V	1.87 kΩ	3.315 V
2.5 V	3.74 kΩ	2.503 V
2 V	6.19 kΩ	2.012 V
1.8 V	8.06 kΩ	1.802 V
1.5 V[2]	13.0 kΩ	1.501 V
1.2 V[2]	27.4 kΩ	1.205 V
1 V[2]	86.6 kΩ	1.001 V
0.9 V[2]	Open	0.9 V

(1) The minimum input voltage is 4.5 V or (V$_O$ + 1.1) V, whichever is greater.
(2) The maximum input voltage is 18 V or (V$_O$ × 10) V, whichever is lesser.

Figure 10. V$_O$ Adjust Resistor Placement
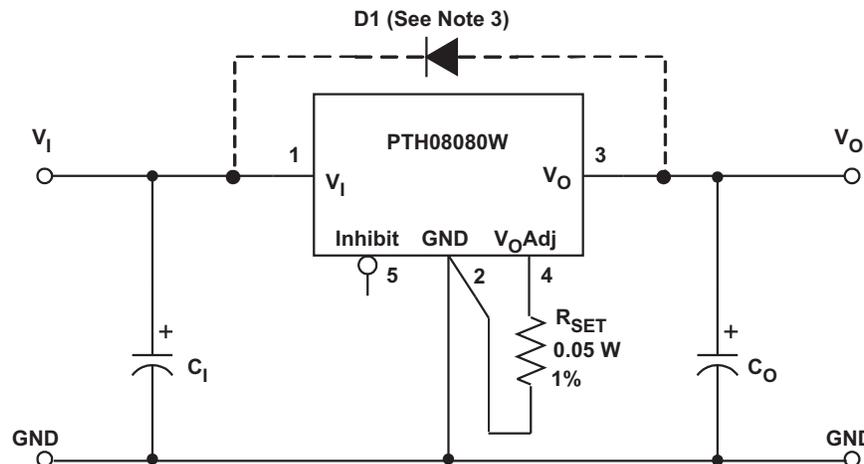

(1) A 0.05-W rated resistor may be used. The tolerance should be 1%, with a temperature stability of 100 ppm/°C (or better). Place the resistor as close to the regulator as possible. Connect the resistor directly between pins 4 and 2 using dedicated PCB traces.

(2) Never connect capacitors from *V$_O$ Adjust* to either *GND* or *V$_O$*. Any capacitance added to the *V$_O$ Adjust* pin affects the stability of the regulator.

(3) The protection diode, D1, is required whenever the output voltage setpoint is adjusted to 5.25 V (or higher) and V$_I$ is 16 V or greater.

CAPACITOR RECOMMENDATIONS FOR THE PTH08080W WIDE-OUTPUT ADJUST POWER MODULES

Input Capacitor

The minimum recommended input capacitor is 100 µF of capacitance. When V_O>3.4 V, the 100-µF electrolytic capacitance must be rated for 650-mArms ripple current . For V_O < 3.4 V, the ripple current rating must be at least 500 mArms. The ripple current rating of electrolytic capacitors is a major consideration when they are used at the input.

When specifying regular tantalum capacitors for use at the input, a minimum voltage rating of 2 × (maximum dc voltage + ac ripple) is highly recommended. This is standard practice to ensure reliability. Polymer-tantalum capacitors are not affected by this requirement.

For improved ripple reduction on the input bus, ceramic capacitors can also be added to complement the required electrolytic capacitance.

Output Capacitors (Optional)

No output capacitance is required for normal operation. However, applications with load transients (sudden changes in load currrent) can benefit by adding external output capacitance. A 100-µF electrolytic or ceramic capacitor can be used to improve transient response. Adding a 100-µF nonceramic capacitor allows the module to meet its transient response specification. A high-quality computer-grade electrolytic capacitor should be adequate.

Electrolytic capacitors should be located close to the load circuit. These capacitors provide decoupling over the frequency range, 2 kHz to 150 kHz. Aluminum electrolytic capacitors are suitable for ambient temperatures above 0°C. For operation below 0°C, tantalum or Os-Con-type capacitors are recommended. When using one or more nonceramic capacitors, the calculated equivalent ESR should be no lower than 10 mΩ (14 mΩ using the manufacturer's maximum ESR for a single capacitor). A list of preferred low-ESR-type capacitors are identified in Table 3, the recommended capacitor table.

Ceramic Capacitors

Above 150 kHz, the performance of aluminum electrolytic capacitors becomes less effective. To further improve the reflected input ripple current, or the output transient response, multilayer ceramic capacitors must be added. Ceramic capacitors have low ESR and their resonant frequency is higher than the bandwidth of the regulator. When placed at the output their combined ESR is not critical as long as the total value of ceramic capacitance does not exceed 200 µF. Also, to prevent the formation of local resonances, do not exceed the maximum number of capacitors specified in the capacitor table.

Tantalum Capacitors

Additional tantalum-type capacitors can be used at both the input and output, and are recommended for applications where the ambient operating temperature can be less than 0°C. The AVX TPS, Sprague 593D/594/595, and Kemet T495/T510/T520 capacitors series are suggested over many other tantalum types due to their rated surge, power dissipation, and ripple current capability. As a caution, many general-purpose tantalum capacitors have considerably higher ESR, reduced power dissipation, and lower ripple current capability. These capacitors are also less reliable as they have lower power dissipation and surge current ratings. Tantalum capacitors that do not have a stated ESR or surge current rating are not recommended for power applications. When specifying Os-Con and polymer tantalum capacitors for the output, the minimum ESR limit is encountered well before the maximum capacitance value is reached.

Capacitor Table

The capacitor table, Table 3, identifies the characteristics of capacitors from a number of vendors with acceptable ESR and ripple current (rms) ratings. The recommended number of capacitors required at both the input and output buses is identified for each capacitor type. This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The rms rating and ESR (at 100 kHz) are critical parameters necessary to ensure both optimum regulator performance and long capacitor life.

Designing for Load Transients

The transient response of the dc/dc converter has been characterized using a load transient with a di/dt of 1 A/µs. The typical voltage deviation for this load transient is given in the data-sheet specification table using the optional value of output capacitance. As the di/dt of a transient is increased, the response of a converter's regulation circuit ultimately depends on its output capacitor decoupling network. This is an inherent limitation with any dc/dc converter once the speed of the transient exceeds its bandwidth capability. If the target application specifies a higher di/dt or lower voltage deviation, the requirement can only be met with additional output capacitor decoupling. In these cases, special attention must be paid to the type, value, and ESR of the capacitors selected.

If the transient performance requirements exceed those specified in the data sheet, the selection of output capacitors becomes more important. Review the minimum ESR in the characteristic data sheet for details on the capacitance maximum.

Table 3. Recommended Input/Output Capacitors

(1) The voltage rating of the input capacitor must be selected for the desired operating input voltage range of the regulator. To operate the regulator at a higher input voltage, select a capacitor with a higher voltage rating.
(2) Not recommended (N/R). The voltage rating of this capacitor only allows it to be used for output voltages bus and voltage of < 5.5 V.
(3) The voltage rating of the input capacitor must be selected for the desired operating input voltage range of the regulator. To operate the regulator at a higher input voltage, select a capacitor with a higher voltage rating.
(4) Ceramic capacitors can be used to complement electrolytic types at the input bus by reducing high-frequency ripple current.

Power-Up Characteristics

When configured per the standard application, the PTH08080 power module produces a regulated output voltage following the application of a valid input source voltage. During power up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. Figure 11 shows the power-up waveforms for a PTH08080W, operating from a 12-V input and with the output voltage adjusted to 1.8 V. The waveforms were measured with a 2-A resistive load.

t - Time = 5 ms/div
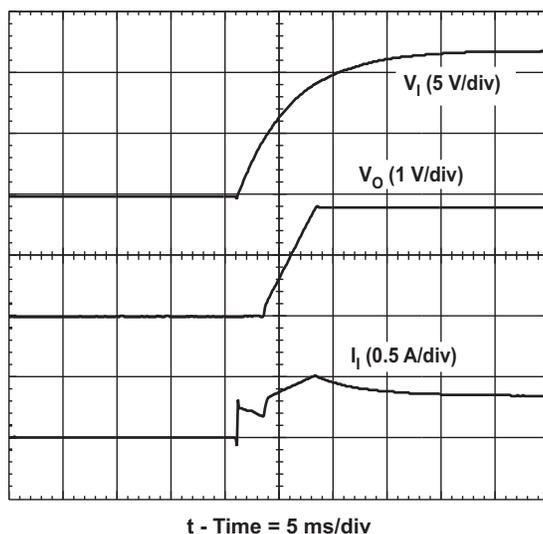

Figure 11. Power-Up Waveforms

Current Limit Protection

The PTH08080 modules protect against load faults with an output overcurrent trip. Under a load fault condition, the output current cannot exceed the current limit value. Attempting to draw current that exceeds the current limit value causes the output voltage to enter into a *hiccup* mode of operation, whereby the module continues in a cycle of successive shutdown and power up until the load fault is removed. On removal of the fault, the output voltage promptly recovers.

Thermal Shutdown

Thermal shutdown protects the module internal circuitry against excessively high temperatures. A rise in temperature may be the result of a drop in airflow, a high ambient temperature, or a higher than normal output current. If the junction temperature of the internal components exceeds 165°C, the module shuts down. This reduces the output voltage to zero. The module starts up automatically, by initiating a soft-start power up when the sensed temperature decreases 10°C below the thermal shutdown trip-point.

Output On/Off Inhibit

For applications requiring output voltage on/off control, the PTH08080 power module incorporates an output on/off Inhibit control (pin 5). The inhibit feature can be used wherever there is a requirement for the output voltage from the regulator to be turned off.

The power module functions normally when the Inhibit pin is left open-circuit, providing a regulated output whenever a valid source voltage is connected to V_I with respect to GND.

Figure 12 shows the typical application of the inhibit function. Note the discrete transistor (Q1). The Inhibit control has its own internal pull-up to 3 volts. An open-collector or open-drain device is recommended to control this input. ***Do not place an external pull-up on this pin.***

Turning Q1 on applies a low voltage to the *Inhibit* control pin and disables the output of the module. If Q1 is then turned off, the module executes a soft-start power-up sequence. A regulated output voltage is produced within 20 ms. Figure 13 shows the typical rise in the output voltage, following the turn off of Q1. The turn off of Q1 corresponds to the rise in the waveform, Q1 V_{DS}. The waveforms were measured with a 2-A resistive load.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
