

ULTRALOW-POWER SC70/SOT-323 PACKAGED 10 mA LDO LINEAR REGULATORS WITH POWER GOOD OUTPUT

FEATURES

- 10-mA Low-Dropout Regulator
- Ultralow 1.2- μ A Quiescent Current at 10 mA
- 5-Pin SC70/SOT-323 (DCK) Package
- Integrated Power Good Output
- Stable With Any Capacitor ($>0.47 \mu$ F)
- Dropout Voltage Typically 105 mV at 10 mA (TPS79733)
- Over Current Limitation
- -40°C to 85°C Operating Junction Temperature Range

APPLICATIONS

- Battery Powered Microcontrollers and Microprocessors

DESCRIPTION

The TPS797xx family of low-dropout (LDO) voltage regulators offers the benefits of low-dropout voltage and ultralow-power operation. The device is stable with any capacitor ($>0.47 \mu$ F). Therefore, implementations of this device require very little board space due to the miniaturized packaging and potentially small output capacitor. In addition, the family includes an integrated open drain active-high power good (PG) output. Intended for use in microcontroller based, battery-powered applications, the TPS797xx family's low dropout and ultralow-powered operation results in a significant increase in system battery operating life. The small packaging minimizes consumption of board space.

The device is enabled when the applied voltage exceeds the minimum input voltage. The usual PNP pass transistor has been replaced by a PMOS pass

element. Because the PMOS pass element behaves as a low-value resistor, the dropout voltage is very low, typically 105 mV at 10 mA of load current, and is directly proportional to the load current. The quiescent current is ultralow (1.2 μ A typically) and is stable over the entire range of output load current (0 mA to 10 mA). When properly configured with a pullup resistor, the PG output can be used to implement a power-on reset or low battery indicator. The TPS797xx is offered in 1.8-V, 3-V, 3.3-V fixed options.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

AVAILABLE OPTIONS†

T _A	VOLTAGE	PACKAGE	PART NUMBER		SYMBOL
-40°C to 85°C	1.8 V	SC70/SOT-323 (DCK)	TPS79718DCKT‡	TPS79718DCKR§	ATD
	3 V		TPS79730DCKT‡	TPS79730DCKR§	ATE
	3.3 V		TPS79733DCKT‡	TPS79733DCKR§	ATF

† Contact the factory for the availability of other voltage options between 1.25 V and 4.9 V.

‡ The DCKT indicates tape and reel of 250 parts.

§ The DCKR indicates tape and reel of 3000 parts.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)¶

Input voltage range (see Note 1)	-0.3 V to 6 V
Maximum dc output voltage	4.9 V
Peak output current	Internally limited
ESD rating, HBM	2 kV
ESD rating, CDM	500 V
Continuous total power dissipation	See Dissipation Rating Table
Operating junction temperature range, T _J	-40°C to 85°C
Operating ambient temperature range, T _A	-40°C to 85°C
Storage temperature range, T _{stg}	-65°C to 150°C

¶ Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to network ground terminal.

DISSIPATION RATING TABLE

BOARD	PACKAGE	R _{θJC} °C/W	R _{θJA} °C/W	DERATING FACTOR ABOVE T _A = 25°C	T _A ≤ 25°C	T _A = 70°C	T _A = 85°C
					POWER RATING	POWER RATING	POWER RATING
Low k [#]	DCK	165.39	396.24	2.52 mW/°C	252mW	139 mW	101 mW
High K	DCK	165.39	314.74	3.18 mW/°C	318 mW	175 mW	127 mW

PG output low voltage	$V_I = 1.5 \text{ V}$, $I_O(\text{PG}) = 1 \text{ mA}$		0.14		0.225	V	
PG leakage current	$V(\text{PG}) = 5 \text{ V}$		0.1			nA	

- NOTES: 2. To calculate the minimum input voltage for your maximum output current, use the following formula:
 $V_I(\text{min}) = V_O(\text{max}) + V_{\text{DO}}(\text{max load})$
3. Continuous output current is limited by internal protection circuitry, but it is not recommended that the device operate under conditions beyond those specified in this table for extended periods of time.
4. The minimum IN operating voltage is 1.8 V or $V_O(\text{typ}) + 1 \text{ V}$, whichever is greater. The maximum IN voltage is 5.5 V. There is no minimum output current requirement and the maximum output current is 10 mA.
5. IN voltage equals $V_O(\text{typ}) - 100 \text{ mV}$; The TPS79730 input voltage is set to 2.9 V and the TPS79733 input voltage is set to 3.2 V. The TPS79718 dropout voltage is limited by input voltage range limitations.

functional block diagram

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
GND	2		Ground
NC	3		No connection
OUT	5	O	The OUT terminal provides the regulated output voltage of the device.
PG	1	O	The PG terminal for the fixed voltage option devices is an open drain, active-high output that indicates the status of V_O (output of the LDO). When V_O exceeds approximately 90% of the regulated voltage, PG goes to a high impedance state. It goes to a low-impedance state when V_O falls below approximately 90% (i.e. overload condition) of the regulated voltage. The open drain output of the PG terminal requires a pullup resistor.
IN	4	I	The IN terminal is the power supply input to the device.

TPS797xx PG timing diagram

- NOTES: A. $V_{min} = V_{OUT} + V_{DO}$
 B. The PG trip voltage is typically 10% lower than the output voltage ($90\%V_O$). V_{IT-} to V_{IT+} is the hysteresis voltage.

APPLICATION INFORMATION

The TPS797xx family of low-dropout (LDO) regulators have been optimized for use in micropower applications. They feature extremely low dropout voltages, and ultralow quiescent current (1.2 μA typically).

A typical application circuit is shown in Figure 16.

Figure 14. Typical Application Circuit

external capacitor requirements

Although not required, a 0.1- μF or larger input bypass capacitor, connected between IN and GND and located close to the TPS797xx, is recommended, especially when a highly resistive power supply is powering the LDO in addition to other devices.

Like all low-dropout regulators, the TPS797xx requires an output capacitor connected between OUT and GND to stabilize the internal control loop. The minimum recommended capacitance is 0.47 μF . Any 0.47- μF capacitor is suitable. Capacitor values larger than 0.47 μF are acceptable.

APPLICATION INFORMATION

power dissipation and junction temperature

Specified regulator operation is assured to a junction temperature of 85°C; restrict the maximum junction temperature to 85°C under normal operating conditions. This restriction limits the power dissipation the regulator can handle in any given application. To ensure the junction temperature is within acceptable limits, calculate the maximum allowable dissipation, $P_{D(max)}$, and the actual dissipation, P_D , which must be less than or equal to $P_{D(max)}$.

The maximum-power-dissipation limit is determined using the following equation:

$$P_{D(max)} = \frac{T_{Jmax} - T_A}{R_{\theta JA}}$$

Where:

T_{Jmax} is the maximum allowable junction temperature.

$R_{\theta JA}$ is the thermal resistance junction-to-ambient for the package (see Power Dissipation Rating Table).

T_A is the ambient temperature.

The regulator dissipation is calculated using:

$$P_D = (V_I - V_O) \times I_O$$

Power dissipation resulting from quiescent current is negligible. Excessive power dissipation triggers the thermal protection circuit.

regulator protection

The TPS797xx PMOS-pass transistor has a built-in back diode that conducts reverse current when the input voltage drops below the output voltage (e.g., during power down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage operation is anticipated, external limiting might be appropriate.

The TPS797xx features internal current limiting. During normal operation, the TPS797xx limits output current to approximately 190 mA. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. Take care not to exceed the power dissipation ratings of the package.

microcontroller application

One application for which this device is particularly suited is providing a regulated input voltage and power good (PG) supervisory signal to low-power devices such as mixed-signal microcontrollers. The quiescent or ground current of the TPS797xx family is typically 1.2 μ A even at full load; therefore, the reduction in battery life by including the TPS797xx in the system is negligible. The primary benefits of using the TPS797xx to power low power digital devices include:

- Regulated output voltage that protects the device from battery droop and noise on the line (e.g., switch bounce)
- Smooth, monotonic power up
- PG signal for controlled device RESET
- Potential to use an existing 5-V power rail to power a 3.3-V or lower device
- Potential to provide separate digital and analog power and ground supplies for a system with only one power source

APPLICATION INFORMATION

microcontroller application (continued)

Figure 17 shows an application in which the TPS79718 is used to power TI's MSP430 mixed signal microcontroller.

Figure 15. MSP430 Microcontroller Powered by the TPS79718 Regulator

Minimal board space is needed to accommodate the DCK (SC70/SOT-323) packaged TPS79718, the 0.1-μF output capacitor, the 0.47-μF input capacitor, and the pullup resistor on the PG pin.
